"In closing their report for the past year, the committee have the pleasure of announcing to their subscribers (many of whom, however, must be already aware of the fact) that at the quarter sessions, held in the month of October, a liberal grant of 500*l.* was voted by the magistrates of the Hundred of Salford to the institution at Blackley. This money will be applied to the erection of a wing at the back of the present building, which will contain rooms for the farm bailiff and his wife on the ground floor, and in the upper story a dormitory for ten boys. So that when necessity demands it, the number of inmates may be raised to a total of sixty instead of fifty, the present limit.

"The committee believe that they may regard this grant as a proof that the service which the Manchester and Salford Reformatory is rendering to this town and district is appreciated by those who are best able to judge of its value. They feel confident that each year the good resulting from its operations will become more and more apparent. The harvest is but just beginning to be reaped, but, God be thanked! it promises to be an abundant one."

The Bookhawker: his Work and his Day. By Henry George de Bunsen, M.A., Vicar of Lilleshall, and Honorary Secretary to the Salop Bookhawking Society. Published for the Church of England Bookhawking Union, at the Depot, Messrs. Aylott and Sons, 8, Paternoster-row, London. 1859.

WE cannot advocate the cause of bookhawking so well as in the words of Mr. de Bunsen's pamphlet. Our readers are doubtless aware that it is now five years since the commencement of this branch of home missionary work, which is now carried on by no less than sixty-six societies, most of them incorporated in the Church of England Bookhawking Union. We have had occasion to notice other papers connected with this subject, a subject on which we are glad to have testimony carrying such weight of authority as Mr. de Bunsen's social labours and social influence must give.

"It would be impossible to enter fully into all the difficulties which I have alluded to as occurring to the hawker in his daily rounds, or to discuss the objections which are made to his peculiar business—from friend or foe. But there are two classes of enemies which we must shortly introduce to the public at large, before they can clearly understand what kind of being a bookhawker is in this our day, or appreciate the work which he is destined to carry on, unmindful of difficulties and regardless of toil.

"The one class of enemies are your political economists. Their objection is, that a parcel of philanthropists—good-natured men, no doubt, but without sufficient knowledge of the rules of commerce or the proprieties which regulate the trading operations of this our mighty land—should club together to supply the public with books of all sorts. They contend that such trading interferes with all legitimate trade in bookselling, and defrauds the town and country bookseller of the profits due to him. It is a very plausible argument, and has a show of right on its side. Yet it is overthrown by the simple statement that no bookseller in country towns (to my knowledge), and very few, if any, in larger towns, object to our hawking operations, or grudge the small profits which, by dint of hard labour, are earned by us. On the contrary, a bookseller in one of the largest of our country towns remarked one day to the secretary of one of our bookhawking associations: 'I am very much in favour of bookhawking associations: the more books are hawked about among the people, the more they will buy of us booksellers. You create the appetite for reading by your bookhawking operations, and we ordinary booksellers will come in for the largest share of the profits. On market-days we shall experience the benefit of your daily labours.' In the same way the great London publishers have, with scarcely an exception, come to see the usefulness of our associations. They supply us with their books on trade terms, and one firm (Messrs. Aylott and Sons, 8, Paternoster-row), is doing an extended business by collecting from all publishers whatever orders are sent to them by the several bookhawking secretaries.

"The other enemies to the bookhawker—whom I cannot help introducing to the public—are a large class of men, belonging more or less to every condition and profession in life, who object to our operations simply on the ground that it is not good for man to read so much. 'There is already too much reading (so they contend), and there are too many kinds of books circulated among the young people or adults of all ranks, especially among the working classes. Let them be satisfied with their Bibles, Hymn and Prayer Books.' This kind of objection to bookhawking must not remain unanswered. I believe that many of those who utter it are sincere, honest men, who strive in their own sphere to battle with evil, and to uphold that which is good. Still I cannot help saying that their objection arises from an utter ignorance of existing circumstances, or at least from a want of acquaintance with the marvellous changes which have been brought about among us by the progress of education, more especially among the working classes. Twenty years ago, perhaps, our bookhawkers might have found little to do. Reading was a privilege of the middle and upper classes: few among the working men could read, or, if they did so, could read with sufficient ease to find pleasure in it. Now, however, that a new genera-

Digitized by Google

tion has sprung up, most of whom can read, and most of whom will read, it is no longer optional with us whether we will or will not supply them with books. It has become a positive duty—and that a truly Christian one—to send good books, of every kind, into every village and hamlet, into town or country. And this for two reasons:—First, if by a more extended system of education we have increased the power and taste for reading, we ought to supply this new want with every kind of good and useful publication—religious and moral, historical and biographical, scientific and amusing, as well as with prints and pictures. Through the eye, quite as much by the ear, the heart and mind of man are fed and nurtured for good, as for evil. Secondly, the evil disposed have, as usual, been beforehand with us; and hawkers of bad books have forestalled us in our work, to an extent which is but little known. For, 'too wise in their own generation' to expose their evil publications to view, they only tempt the weak, or pander to the taste of the already vicious, or initiate 'into the mysteries of vice' any casual inquirer; and, under the cover of boot and shoe laces, or well hid by a fair sprinkling of blameless or even religious books, this class of hawkers (whether men or women) carry about with them some of the most abominable publications which the most wicked of men ever penned, or the most depraved imagination can conceive. Our bookhawking societies, therefore, have not come into the field a moment too soon. The evil I am complaining of was increasing rapidly; and, therefore, legitimate bookhawking has not only become a duty, owing to the increase of education amongst the working classes, but a necessity, owing to the aggressive nature of our work. We must endeavour to drive away the hawkers of bad books. We can only hope to succeed in our endeavours by offering for sale—at every cottage door, at every tradesman's shop, at farmhouses, as well as to gentlemen's servants,—good books of every kind, at the cheapest possible rate.

"On the other hand, the hawker will meet with farmers who rejoice at the general improvement which they observe in their men. A farmer one day remarked to a hawker that he was 'much pleased with the increased intelligence in his waggoner,' laughing while he said so; that 'he had found in his room a fine writing-desk, and books of such a description that he should not have expected.' In the same way men in smock frocks will astonish the delighted hawker by asking for a book on a scientific subject, or a blacksmith at some country forge will buy a 'Milton,' or a shoemaker 'Paley's Evidences,' or the 'Horæ Paulinæ.' Altogether the improvement is great in this respect, especially in mining districts, where the 'Lives of Great Criminals,' or the 'Newgate Calendar,' or Tom Payne's works, were the books most in vogue. Now miners ask for Bunyan's or Oxenden's works, or for books relating to the geos graphy and natural history of the Bible.

"Thus alternating between encouragement and indifference, if not positive discouragement, the bookhawker plies his trade from about six or seven in the morning till twelve among cottagers; from twelve to one at farm-houses; from one to two at gentlemen's houses: the dinner time being the best time to find all the servants together. But here new difficulties arise. He is asked for books which cannot so much as be named. 'At one large house (writes a hawker) one of the upper servants, the butler I supposed him to be, called me into a private room, and there asked me for some very bad books. However, after some talk, I induced him to buy "Common Objects of the Country," "The Wide Wide World," and one of the cheap song books. In a draper's shop I was asked for the same kind of books, and prevailed on the parties to buy other books. One day I asked, at two clergymen's houses, for the same kind of books. But I am not always successful in inducing the parties to buy good books: they will turn away, vexed and disappointed, when they find that you cannot supply them.'

"Here, then, is another feature in the bookhawker's missionary labours: the taste for reading bad books has to be turned into a contrary and directly opposite channel. To the master or mistress of the house these depraved tastes are unknown: the clergyman in the parish may accidentally have heard the facts, but cannot combat the evil. But an earnest-minded bookhawker may, and he *ought* to do so. He becomes an aggressor of the evil existing and carried on in secret places, and, if he be honest, can do much to lessen it, and in time, with God's blessing, to destroy it insensibly, by substituting good books for bad ones. In short, he must be a wary and watchful man, this hawker of ours—watchful especially over his own temper; and, in more instances than one, he cannot but be practically mindful of the apostle's golden rule, 'Be not overcome with evil: but overcome evil with good!'

"There is, then, on the other hand, much to encourage the real hard-working bookhawker, especially if he shows perseverance in the work allotted to him. No cottage should be passed over, no farm house left unvisited, and servants in gentlemen's families, as has been shown, are by no means so civilised or perfect as not to be amenable to the good and wholesome influences of the poor man's hawker. Nor should the towns be neglected. The best way of proceeding in them is for the hawker to call one day and leave at each house, small or great, a catalogue of the books generally sold, and to request leave to call another day for orders. By good management he may induce the inmate of the house at once to inspect his pack, and this may lead to purchases being made on the spot, saving time and labour. Otherwise, calling a day or two after, he will generally find that his catalogue of books, recommended as they are by the secretary or committee of the association, will have served as a good introduction to him, and, as a consequence, lead to purchases of books or framed pictures. These latter should be always carried by those hawkers who have a hand or donkey cart large enough to admit of such a useful commodity. That much remains yet to be done in towns the two following anecdotes will clearly show:—

"'I called at a sweep's, in —— (writes a hawker), a mere hovel, full of dirt and squalor, and sold, most unexpectedly, a Concordance, a Saints' Rest, and a Dictionary. This man said that he should not have thought of going into a shop to buy those books,—why (said he), they would have ordered me out.'"

"'In another town of S——, one day (writes another hawker) my boy was looking into a bookseller's shop with a book in his hand. A man standing by the side of him, and also looking in at the window, asked the boy if he had that book—pointing to a book in the shop window. "Yes," replied the boy. "Let me look at it." The boy did so, and sold the book close to the shop door. This proves the reluctance of people to go into a shop.'"

"Even on the high road, or in byeways, work is to be done. A man 'with a drove of sheep' will readily buy books, or a man 'carting manure' will be glad to invest his earnings in some good picture. And when the day is over, especially the short days of winter, the bookhawker's evenings are not without use. A hawker who has been at work for a few years cannot fail to make acquaintances in every place where he takes up his abode. To visit these in the evening, to talk over with them his work since they last met, to encourage them to lay up something every week for the purchase of good and instructive works, to hear from them what amount of instruction and pleasure they have derived from the books bought before—all these are points which need not be dwelt upon, but will naturally follow or accompany the honest efforts of an earnest-minded man. So also he may enliven part of the evening by reading aloud part of some good book to the inmates of the family he lodges with, and sanctify their meeting by joining in their family evening worship, or by showing them how to conduct it."

There seems by this account of the Hawker's work and influence an analogy between his labours and those of the Bible-women described in L. N. R.'s book, "The Missing Link;" they penetrate where ordinary bookselling would never find a demand. And, as in the case of those other social missionaries, though much depends on the personal zeal and capacity of the agents, much and more also depends upon those who maintain and employ them, and to whom they look, not only for their stock in trade, but for the counsel and sympathy which shall help them to understand and honour their own work, so as to further it by their personal influence and social example.

The Comparative Properties of Human and Animal Milks. By M. A. Bayner. London, 1860. John Churchill, New Burlington-street.

The title of this book would seem to assign any review of it to the pages of a medical rather than of a social journal. But as its practical purport is one of general sanitary interest—for though we may not all be

Digitized by Google

called upon to rear babies, we have all most assuredly passed through babyhood, and profit or suffer to this day from the good or bad nursing of our baby days—we are glad to direct towards it the attention of any reader who has a parental duty, actual or deputed, to consider the subject.

The moral evils of wet nursing are not confined to the deserting mother who is hired to nurse, or the deserted child she leaves for hire; her foster child imbibes something of her temperament, to what degree cannot be decided or proved, but the fact that it does risk imbibing it at all ought to weigh seriously against any supposed difficulty of hand-feeding.

It is customary to take a tone of strong censure or pathetic remonstrance with mothers who do not nurse their own children. Doubtless, it is the healthiest and happiest state of things that a mother should be able and willing to discharge every duty, physical and moral, towards her child. But it must be remembered that mothers of the classes who most frequently substitute strangers for this office would often be very ill-qualified to perform it themselves. High civilisation and indolent effeminate lives do not make strong constitutions and even temperaments, neither can mother's love nor a sense of duty overcome physical inefficiency. But why there is to be no alternative between rendering this particular office personally and consigning the child to a stranger, is a question that every mother ought to inform herself upon, before she releases herself from *all* her duties as a nurse because she cannot fulfil that one.

Let any one read a column of the *Times'* advertisements of nurses "in a nobleman's or gentleman's family," and then say how a woman of any common sense, putting feeling out of the question, can hand over her child to be reared by the advertisers as she would give her plate to the butler or her dressmaking to her maid.

If a child is deprived of its natural food, the mother, whose inefficiency so deprives it, is bound to supply it by her personal judgment and personal attendance. Affection *can* do this, though it cannot alter nature, and if parents would observe closely the difference between children whose earliest infancy has been ministered to by educated mothers, and those left to servants, we believe many intellectual women who now underrate the importance of nursery life to concentrate their whole energies on the school-room, would find there was as much to be done before a child can receive an intellectual lesson as after; and, finding that, would prove as wise and tender mothers to their children's physical and moral being in infancy, as they are to their fuller development in advancing youth.

Female School of Art.—Her Majesty has been graciously pleased to permit the Koh-i-noor diamond, which has been re-cut since the Exhibition of 1851, to be exhibited at the South Kensington Museum, in aid of the fund for building the Female School of Art. A large collection of ancient and modern jewellery will also be lent on that occasion. Tickets are obtainable at the Museum, and at Mr. Mitchell's, Old Bond-street.

Opening Public Institutions in the Evening.—A select committee of the House of Commons upon this subject, moved for by Sir J. Trelawny, sat several days in March last, and took the evidence of many witnesses, which has now been published along with the report. Several places were indicated that might be opened in the evening—the National Gallery, some departments of the British Museum, the Tower, the East India Museum, the Geological Museum, the Houses of Parliament during the recess. It appears that there would be no great risk of fire, and the burning of gaslights does not injure pictures if the gas-burners are higher in the room than the pictures, and the room is properly ventilated at the top; but bad ventilation in crowded rooms is very injurious to pictures. It was suggested, to meet any doubt upon this, that it might be well not to exhibit in the evening the unreplaceable works of the greatest masters, especially as their peculiar merits are held to be imperceptible except to persons who have given many years of study to qualify themselves to discover them. On the question whether the working classes would go, after a hard-working day, the evidence is that by degrees they would go. They consider "that knowledge is power," said Mr. Ruskin; "there is a thirsty desire for information and improvement in every direction, increasing day by day, and likely to increase, and it would grow by what it feeds upon," though he lamented that, except among the very good workmen, it so much takes the shape of a desire to rise out of their class instead of being happier and wiser in it. At present they cannot go to these institutions. Mr. Cole mentioned that he questioned 1,669 artisans, and found that only 137 had ever been to the National Gallery. Working men who had made inquiry among their fellow-workmen gave evidence of their strong desire that such institutions should be open at a time when they can see them, and stated that many of them would avail themselves of the opportunity. But the best proof of all is that to the South Kensington Museum the working classes do go in an evening. Of the advantage there can be no doubt. It is an agreeable and healthy mode of improving the mind, and has an elevating effect upon the tone of the people. Mr. Ruskin's view is, that "nothing assists the working man so much as having the moral disposition developed after his work; anything that touches his feelings is good, and puts new life into him; therefore (he says) I want pictures of that class which would ennoble and refine by their subjects." The committee report in favour of opening such institutions in the evening, and they recommend clear, legible, descriptive labels, placed against specimens, and simple catalogues sold at a small cost, and occasional short popular lectures; and also that surplus works of art and duplicate specimens from the museums be exhibited in different parts of the metropolis, wherever responsible parties will provide suitable premises. This would also have the advantage of providing exhibitions which are not so vast as to bewilder; in a great museum a man, especially if his mind is languid with labour, wanders about listlessly, and gradually tires of it.—*Times.*

The Materials of Paper.—The following letter, on the collection of rags for the manufacture of paper, has been addressed to the parochial clergy, the managers of parochial institutions, &c., by Richard Herring, the author of a number of works upon the manufacture of paper:—"The late discussions in Parliament have brought the subject of papermaking and its materials prominently before the public. British machinery and industry produce the finest paper in the world, and are capable of commanding the market of the world. But papermaking demands a supply of rags, and the Continental duties at present curtail that supply. England requires at least 120,000 tons yearly, of which she supplies but 40,000. The question is, can that home supply be enlarged? I am confident that it can, and to an extent more than adequate to all its demands. The collection of rags has hitherto been by a small traffic in the hands of petty dealers; and the general carelessness of collection and the lowness of price have equally diminished the quantity. It has been ascertained that in scarcely 50 houses out of every 100 any collection is ever made. This negligence arises partly from mistakes as to the nature, value, and manner of the due collection. It has been commonly supposed that white rags alone are of use in paper making. But coloured rags generally are useful, and even waste paper can be valuably employed in the manufacture. Every housekeeper ought to have three bags—a white one for the white rags, a green one for the coloured, and a black one for the waste paper (the three might be furnished for 1*s.*), which would prevent litter waste, and the trouble of collecting when the demand came. A suitable agency formed in the towns and villages would settle all demands, arrange the contributions, and reduce the whole into a regular trade. Parochial officers would find attention to this subject a very effectual mode of increasing the means at their disposal for charitable purposes. The general apprehension that we require French or foreign rags for our manufacture is a mistake; we have a sufficient supply at home, if we will but make use of it. There are more rags wasted, burnt, or left to rot, than would make our paper manufacturers independent of all assistance from abroad. A regular communication ought to be formed by country carriage, and by railroads, for the conveyance of the bags to London, or to those paper-mills in the country which enter largely into the trade. A plan is proposed which will place the whole subject plainly before the public, offer proper pledges, establish proper means, and give the whole movement the degree of activity and regularity which

Digitized by Google

may render it profitable to individuals and the country. The long acquaintance of the writer with the details of the trade enables him to speak with full knowledge of its necessities, its means of success, and its peculiar value to the general interests of commerce. It not less permits him to speak with confidence of the results of relying on our own resources in the present difficulty. We require only the application of the means in our possession. A little industry, a little intelligence, and an established system, would perfectly secure us from failure in an important branch of art and trade, already worth 6,000,000*l.* sterling, employing a large number of skilled workmen, and conducing, most effectually, to the industry and comfort of the peasantry, and to the trade and resources of the empire. The present subject is not altogether voluntary; it has been urged on me by letters from various quarters, all expressing the same necessity for making an effort in this direction, for calling the public attention to our resources, and for giving a new impulse to a trade which has hitherto been limited, but which may be carried successfully wherever British commerce extends over the globe."

School for the Indigent Blind.—A concert of a most interesting character was given in the Hanover-square Rooms, June 5th, before a very numerous and fashionable audience, among whom were the Duchess of Wellington, the Marquis Lansdowne, Marchioness of Exeter, Lady Burleigh, Marchioness of Salisbury, Marquis and Marchioness of Townshend, Viscount Cranbourne, Viscount Raynham, Lord and Lady Ebury, Lady Rosa Greville, Lady Braybrooke, Hon. Misses Grosvenor, Bishop of Chichester, Hon. E. Legge, Ladies Legge, Lord Eustace Cecil, Baroness Rothschild, &c. Most of these distinguished persons are among the warm supporters of an excellent institution, established two years since, under the title of Society for granting Annuities to the Blind, the objects of which, in all respects deserving publicity, may be best set forth in the language of the official prospectus:—"This society is established on behalf of the many thousands of blind persons who are known to be the greatest sufferers from poverty of any class; who are frequently homeless, always dependent on others, though generally respectable, of good moral character, and often useful in their own neighbourhood. The society desire, first, to aid in the support of blind persons who form so great a burden on a family as to render it homeless or destitute. Secondly, to prepare half-yearly lists of all such persons, so that relief may be afforded by election to a pension for one year of 6*l.*, or by private liberality, without the possibility of fraud, waste, or personal inconvenience. Thirdly, to distribute aid by pension annually, without expense of agents, and to select candidates for election by the subscribers."

A Defence of the London Clubs.—The young man about town in London of the present day is a great improvement, in my humble opinion, upon the Tom and Jerry type which found favour in the eyes of our fathers. At least in a London club young gentleman associates with young gentlemen of his own class—his dinner is put before him with an attention to cleanliness and propriety, of which, if English homes, almost of the humblest kind, are destitute, all I can say is, the English homes ought to be very much ashamed of themselves. It may probably surprise you to hear—but it is, notwithstanding, the truth—that 80 per cent. (I might even say more) of the dinners furnished every day to the members of the London clubs collectively are served at rates varying from 2s. 9d. to 3s. 6d.,—surely a charge which does not imply any very wild degree of luxury or extravagance. The older members will then retire to the newsroom or the library, and doze in comfort over their paper or their novel; and what would the poor old gentlemen do but for the resources of their club? The younger ones disappear in the smoking-room, where at least they meet with gentlemen like themselves, who—astounding as such an assertion may appear—would not, with rare exceptions indeed, tolerate any other subjects or forms of conversation than such as would be employed at your own dinner table. Let us follow them upstairs to the billiard-room. The time has happily gone by when it was supposed that a youth who would play a game at billiards was in a fair way to perdition; but even the bitterest opponents of that amusement can scarcely deny that it may be more safely indulged in among friends and gentlemen, members of the same club, than among the blacklegs and sham captains of the public billiard tables.—*Once a Week.*

Bath and West of England Society for the Encouragement of Agriculture, Arts, Manufactures, and Commerce. — The annual meeting of this Society was held at Dorchester during the week beginning June 4th. At the general meeting of the members held on Thursday, 17th, Lord Rivers in the chair, the report read by the secretary, Mr. Moule, stated the Society to be gaining ground, and the subscribing members to be on the increase. The exhibitions in the various departments were highly satisfactory, and the attendance of visitors, notwithstanding the unfavourable weather, numerous.

A private conversazione of the Ladies' Sanitary Association was held on Wednesday, June 13th, at the residence of the Hon. Mrs. Wm. Cowper, Curzon-street, May-fair, when a report of the proceedings of the Branch Society at Brighton was read by Mrs. William Fison, and the best method of introducing sanitary knowledge among the poor was discussed. Among the ladies present were the Countess of Airlie, the Hon. Mrs. Jocelyn Percy, the Hon. Miss Stanley of Alderley, Lady Victoria Noel, Mrs. Ranyard, Mrs. Thomson Hankey, Lady Gainsborough, Lady Florence Cowper, Lady Adine Cowper, Mrs. Henry Rich, Lady Harding, and others. Some of the "Bible women" employed in the metropolitan districts were also present, they having many opportunities and much practical influence for advocating sanitary truths among the ill-housed and crowded poor.

A meeting of precisely similar kind was held the next day at the residence of Mrs. Russell Gurney, 8, Kensington Palace-gardens.

Compulsory Education.—The Factory Reports generally contain some reference to the regulation under which children employed in factories are required to be at school for part of the day. In the reports presented to Parliament this session one of the inspectors, Mr. Baker, mentions that he had occasion last year to request some certifying surgeons to test the educational condition of children between eight and sixteen, who were brought to them for certificates of age with a view to being admitted to employment; and a supposition getting abroad in consequence that shortly no child would be allowed to work in the mills that could not read, the number of applicants for admission to the schools was so great in one district that within a fortnight all the schools were filled. This is adduced as a proof that if parents were assured that no child would be permitted to work which did not produce to the employer a certificate of elementary education, the education would be procured for the children almost universally. Mr. Baker considers that the half-time labour and half-day education of the factory system might be carried into effect in all congregated labour, but he questions whether at present it could in diffused labour; in agrarian pursuits the hours of work are dependent upon a variety of contingencies, and in mines the removal of the "getter" would stop the "hurrier," and double sets of children could not always be obtained. But he maintains that a preliminary certificate of education as a condition of a child being employed might be enforced after a five years' notice of its peremptory requirement. In these factory reports Mr. L. Horner, who was one of the original inspectors of factories, and who resigned office last year, states in his final report, made up to November last,—"I am persuaded that in no way can the children of the operative classes be placed in more favourable circumstances than while working in a well-regulated factory under the conditions of the existing law. Their half-day's employment can do no injury to their health, they are exposed to no undue exertions, and they are sheltered from the weather in a dry and warm room—a great contrast to what most of them would otherwise be exposed to; if the school to which they are sent daily for three hours be a reasonably good one, they get the advantage of some education, and in many of the schools they obtain the lasting benefit of most effective teaching. When they are in the mill they acquire regular and industrious habits, and by the work they are set to and by what they see around them their wits are sharpened, and they earn wages that must go a good way towards their maintenance."—*Times.*

A Good Family Medicine Chest, with a prudent use, has saved many a life; and yet we think the idea might be improved upon, and reduced to a more simple form. Take some good compound, such as Cockle's Antibilious Pills, and we find that the desired end may be obtained without scales and weights, or little mysterious compartments and enchanted bottles with crystal stoppers. Others might be used, but Cockle's Pills, as tested by many thousands of persons, and found to answer their purpose so well, may be set down as best.—Observer.

BIBLIOTHECA

The Philanthropist,

AND

SOCIAL SCIENCE GAZETTE.

VOL. V.—No. 63.] AUGUST 1, 1860. [Annual Subscription, 6s. PAYABLE IN ADVANCE.

REFORMATORY AND REFUGE UNION.

PRESIDENT: The EARL of SHAFTESBURY.
TREASURER: ROBERT SMITH, Esq., 1, Lombard-street, E.C.
HONORARY SECRETARIES:
ROBERT HANBURY, Esq., M.P., 10, Upper Grosvenor-street, W.
STEPHEN CAVE, Esq., M.P., 35, Wilton-place, S.W.
BANKERS:
Messrs. SMITH, PAYNE & Co., 1, Lombard-street, E.C.
Messrs. RANSOM, BOUVERIE & Co., 1, Pall Mall East, S.W.

Contributions are earnestly solicited for the following purposes:—

GENERAL FUND.—For maintaining the general operations, corresponding with the various Institutions throughout the country, procuring the admission of convicted or destitute persons into suitable asylums, publishing Handbooks of information, and generally assisting in the work of Reformatories.

REFUGE FUND.—For making Grants towards the support of existing Institutions, and aiding in the formation of new ones where found necessary; contributing towards the Emigration of those whose good conduct has commended itself to the managers of the Institutions where they have been located; and in other ways assisting the Houseless and the Destitute.

FEMALE MISSION FUND.—For maintaining a Mission to the Fallen Women of the metropolis, and, as may be found practicable, of the country at large; to employ Female Missionaries to labour amongst them; to give donations with cases admitted to the Homes by their instrumentality; and to assist by Grants the Institutions established for the reception of this class.

Further information may be obtained by reference to the Publications of the Union, to be had on application to the Secretary.

A. O. CHARLES, Secretary.
Office of the Union, 118, Pall Mall, S.W.

REFORMATORY FOR JUVENILE MALE CRIMINALS under 16 years of age.—The HOME in the EAST, Old Ford, Bow, near London.

PRESIDENT,
THE EARL OF SHAFTESBURY.
TREASURER,
JOSEPH CRANE, ESQ.
BANKERS,
MESSRS. HANKEY & Co.
HONORARY SECRETARIES,
A. J. SCRUTTON, Esq., 81, Old Broad Street;
THOMAS SCRUTTON, Jun., Esq., 3, Corbet Court, Gracechurch Street.
GOVERNOR,
Mr. J. W. GORDELIER, at the Institution.

Fifty youths are maintained at an annual average cost of about £1000.

Contributions are earnestly solicited, and will be gratefully acknowledged.

SAVINGS BANK DEPARTMENT.

SOUTHWARK, METROPOLITAN, and PROVINCIAL FREEHOLD LAND and HOUSE SOCIETY.

Trustees,
Thomas Pillow, Esq., James Pollock, Esq., and W. H. German, Esq.

FIVE PER CENT. ON DEPOSITS.—Dividends payable on and after the 1st of January and the 1st of July.

Offices: 4, Wellington Chambers, London Bridge, Southwark.
RICHARD BRETT, *Secretary*.
Prospectuses forwarded on application.

ROYAL NORTHERN SEA-BATHING INFIRMARY: established in 1811.—A New Infirmary, long very much needed, is now in course of erection. £2,000 is required to complete it. This Charity is intended to provide a Home for patients, from all parts of the kingdom, requiring sea air. It is supported entirely by voluntary contributions, and these are earnestly solicited.

THOMAS HUTTON CROFT, *Hon. Sec.*

METROPOLITAN FREE HOSPITAL
Devonshire Square, Bishopsgate, City, N.E.
PATRON.
H. R. H. THE PRINCE CONSORT, K.G., &c.
VICE-PATRON.
THE RIGHT HON. THE LORD MAYOR.

This Institution is continually open to the Sick Poor of every nation, without requiring a letter of recommendation. It is entirely dependent upon voluntary contributions for its support, and is urgently in want of Funds.

BANKERS: Messrs. BARNETT, HOARE, and CO, Lombard Street, E.C.

GEORGE CROXTON, *Secretary*.

ONE SHILLING PER SHARE.

THE ART UNION of GREAT BRITAIN, under the sanction of Her Majesty's Most Honourable Privy Council.

First Prize, Painting, value £150
Second „ „ „ £100
with 98 other Picture Prizes, from £5 to £75 each.

Prizeholders have the privilege of selecting their own paintings from any Public Exhibition in Great Britain or Ireland.

In addition to the above Picture Prizes there will be about 500 other prizes, consisting of Engravings, Statuettes, Busts, Vases, &c., in Parian, Terra Cotta, and Bronze.

Tickets, price One Shilling, each ticket entitling the holder to one chance in the drawing, may be had from all the principal Printsellers, Music and Booksellers, and from the office of this paper; or they will be forwarded direct by the Secretary on receipt of an envelope (stamped and directed), together with postage-stamps or post-office order for the number of tickets required.

39, Princess-street, Manchester. SAMUEL H. DEAN, Secretary.

PHRENOLOGY APPLIED TO CHILDREN may lead to the avoidance of many of the errors so frequently committed in their education and subsequent destination. During Mr. DONOVAN'S long and extensive practice as a consulting phrenologist, his attention has been particularly directed to this most important branch of cerebral science. Consultations from 9 to 6 daily. Free Lectures on Monday evenings, as usual. 1, Adelaide Street, Trafalgar Square, W.C.

ALARM GUN.—Capt. NORTON'S ALARM GUN, without vent or touch-hole, fired at the muzzle by friction, for protection against burglars, poachers, &c., is to be had of the London Gunmakers: Field, Blisset, and Beckwith, Holborn; Reily, New Oxford Street; Lang, Cockspur Street; Daw, Old Broad Street; and Wilkinson, Pall Mall.

WHAT WILL THIS COST TO PRINT? is a thought often occurring to literary minds, public characters, and persons of benevolent intentions. An immediate answer to the inquiry may be obtained, on application to RICHARD BARRETT, 13, Mark Lane, London. R. B. is enabled to execute every description of PRINTING on very advantageous terms, his office being furnished with a large and choice assortment of Types, Steam Printing Machines, Hydraulic and other Presses, and every modern improvement in the Printing Art. A Specimen Book of Types, and information for authors, sent on application, by

RICHARD BARRETT, 13, MARK LANE, LONDON.

WHY GIVE MORE?—Excellent TEAS, Black, Green, and Mixed, are now on sale, for Family Use, at **2s. 8d.** per pound, at NEWSOM and Co.'s Original Tea Warehouse, 50, Borough. Near London Bridge Terminus. Established A.D. 1745.

SPECTACLES—MICROSCOPES—TELESCOPES.—FINE STEEL FRAMES, with REAL PEBBLES, 7s. 6d. and 10s. 6d.: ditto, best Glasses, 5s. 6d., 4s. 6d., 3s. 6d.; Solid Gold, 20s.; Silver, 10s. 6d.

BERNARD DAVIS, 430, Euston Road, Regent's Park (close to Trinity Church). Optician to the Ophthalmic Institutions. Country residents can be accurately suited by stating age, &c. Enclose stamps, or P. O. order, payable Upper Baker Street, London.

MICROSCOPES, magnifying from 5,000 to 15,000 times, mahogany cases, 21s., 17s. 6d, 12s. 6d. Ditto, with all necessaries for every purpose, in upright Mahogany Cabinet, magnifying 60,000 times, £4 4s., warranted.

POCKET TELESCOPES, define ten miles, 10s. 6d.; ditto, 20 miles, 21s.

SMALL POCKET TELESCOPES, of immense power, and to show Jupiter's Moons, &c., by night, 60s.

MAGIC LANTERNS and SLIDES complete, 6s. 6d., 9s. 6d., 11s. 6d., 18s. 6d, 21s., 30s., up to 90s. Catalogues free for one stamp.

MISS GEORGIANA COUVES, PIANISTE, (Organist at St. Saviour's Chelsea), late of Queen's College, where she obtained two First Class Certificates for Instrumental Music, Harmony and Composition, under the tuition of Dr. Sterndale Bennett, begs to announce that she will be happy to attend Private Families and Schools in any locality, within twelve miles of London, to give instruction on the Piano, Organ, and Composition. 35, Stanley-street, Ovington-square, Chelsea, S.W.

THE BOOK-HAWKING CIRCULAR. No. V., April, 1860. Pp. 20 (quarterly), price 1d.

The BOOK-HAWKER: his Work and his Day. Second Edition. By Rev. H. G. De Bunsen, M.A.

BOOK-HAWKING, in connection with EDUCATION. By Rev. Nicholas J. Ridley, M.A.

Published for the "Church of England Book-Hawking Union." Price 2d. each, or 7s. 6d. per 100.

AYLOTT & SON, 8, Paternoster-row.

THE FEEDING AND REARING OF INFANTS.
Just published, price 1s.

THE Paper that was read at the HANOVER-SQUARE ROOMS, "ON THE COMPARATIVE PROPERTIES OF HUMAN AND ANIMAL MILKS," &c.; A Remonstrance addressed to Medical Men and Mothers on the Present System of Feeding and Nursing. With suggestions for preventing the enormous amount of Sickness and Mortality amongst Infants.

London: Published by John Churchill, New Burlington-street, W. Sold also by L. Booth, 307, Regent-street, W.; W. Tweedie, 337, Strand, W.C.; W. Simpson, King's-road, Brighton.

A NEVER-FAILING RECEIPT for 30 Stamps, to make the HAIR GROW and CURL.

very valuable RECEIPT for 30 Stamps, to make a FIRST-CLASS HAIR-DYE.

LADIES! If you wish your Skin to be Clear, Fair, and Blooming, send me 30 Stamps, and I will forward you the receipt. Its effect is surprising. It removes Tan, Freckles, Pimples, and other unsightly marks. It is perfectly harmless, and may be prepared by any lady at a trifling cost. These Receipts are superior to anything of the kind hitherto discovered.

INSTITUTION for the EMPLOYMENT of NEEDLEWOMEN, 26, Lambs' Conduit-street, W.C.

PATRONS.
The LORD BISHOP of LONDON.
The LORD BISHOP of OXFORD.

PRESIDENT.
The EARL of SHAFTESBURY.

LADY PATRONESSES.

The Duchess of Beaufort.	Mrs. Tait.
The Lady Elizabeth St. Aubyn.	Mrs. Gurney.
	Mrs. Cave.
The Lady Emily Stratford.	Mrs. Alers Hankey.
The Lady Radstock.	Mrs. Head.
The Hon. Lady Mason.	Mrs. Gell.
Hon. Mrs. Sydney Herbert.	Mrs. Bayley (Authoress of "Ragged Homes.")
Lady Troubridge.	
Lady Lindesay Bethune.	Mrs. S. C. Hall.
Lady Havelock.	Mrs. Bracebridge.
Lady Hart.	

TREASURER.
Stephen Cave, Esq., M.P.

SECRETARY AND LADY SUPERINTENDENT.
Miss Ellen Barlee.

The Institution for the Employment of Needlewomen has been formed to assist workwomen of good character, by obtaining work for them, and securing to them the full average remuneration which they would receive were they able to take the work directly from the establishments for which it is executed, instead of obtaining it through the agency of a sub-contractor.

It is calculated that the lower classes of needlewomen in London exceed 30,000 in number. Of these a large proportion working from 10 to 18 hours per day, do not earn more than from 2s. to 6s. per week. Taking into account the slack season, illness, and inability to procure work, many can scarcely average half that sum. It may reasonably be expected that each worker employed by the Institution will be able to earn from 5s. to 9s. per week, an amount on which they can at least subsist, and which will save them from the terrible privations, and consequent temptations to dishonesty and vice, with which they have now to struggle

To make an Institution of this kind permanent, and worthy of public support, it ought not to be a merely charitable effort, but must ultimately be supported to, at least a great degree, by those who benefit by it. The women employed, therefore, will be required to pay a small percentage on their earnings, (say a penny in each shilling,) towards the necessary expenses of rent and taxes, fuel, superintendence, etc. A contribution to this amount from 300 women, earning, on an average, 1s. per day, would fully meet all the ordinary charges of the Institution. But some time must elapse before the Society can secure employment for so many, and in the interval, the same machinery being required, its objects can only be attained by the help of those who feel an interest in the class which it desires to benefit.

For this aid the promoters of the Institution would confidently appeal. They believe the Institution eminently calculated to promote industry and good conduct in the women employed, and to permanently improve their religious and moral condition.

They would gratefully acknowledge the kind assistance which they have already received, and which has encouraged them to commence their undertaking by engaging the premises they now occupy at 26, Lambs' Conduit-street. Here Work-rooms have been prepared sufficient for the employment of about sixty workers, with a dormitory for the accommodation of a few of the most friendless and destitute—women with families being allowed to take the work to their homes. Further subscriptions are absolutely necessary to enable them to carry out their objects effectively; and especially to provide a Guarantee Fund, from which the parties who intrust work to the Society may receive security if desired, and may be indemnified for any incidental loss or damage. Such additional assistance the promoters of this Institution would earnestly solicit, as well as supplies of work, to allow of their giving the women constant and regular employment.

A single Institution of the kind now established, can only partially provide for the wants of so numerous a class, but should this effort succeed, and sufficient funds be obtained, it is intended to open Branch Institutions in other parts of London.

The Institution is open to the inspection of Visitors from 10 to 5, each week-day Mondays and Saturdays only excepted.

Post Office Orders addressed to the Secretary may be made payable at the Post Office, 62, High Holborn, W.C.,

Donations will be thankfully received by Messrs. Prescott and Co., Bankers, Threadneedle-street.

Further details will be found in a little work, entitled "Our Homeless Poor, and What we can do to Help them." J. NISBET and Co., Berners-street, and of all Booksellers.

"Parcels of cast-off clothing will be thankfully received for the poor women, many of whom are most destitute.

PHOTOGRAPHY.—This beautiful and wonderful art has long been in the hands of mere charlatans and speculators, whose imperfect knowledge and unskilful manipulations have produced only vile caricatures of our friends. Mr. Barrable, 244, Regent-street, is the first, who, with the reputation of an artist, has applied himself to the study and practice of Photography. In his studio the most beautiful portraits are produced at half the usual prices charged at the West End for much inferior articles. Mr. Barrable respectfully invites the public to an inspection of his specimens.

IMPORTANT to every Man who keeps a Horse, Cow, Sheep, or Pig. The receipt to make the celebrated HORSE and CATTLE FOOD, for 13s. per cwt., the selling price being 42s. and 50s. per cwt.

N.B.—Two receipts sent for 44 Stamps; three for 60 Stamps; or the four for 78 Stamps.

Address, Mr. J. TAIT, Chemist, Newcastle-on-Tyne.

BROWN and POLSON'S PATENT CORN FLOUR,

Preferred to the best Arrowroot.

Delicious in Puddings, Custards, Blancmange, Cake, &c., and especially suited to the delicacy of Children and Invalids.

The *Lancet* states—"This is superior to anything of the kind known."

Trade Mark and Recipes on each Packet, 4 and 16 ozs.

Obtain it where inferior articles are not substituted, from family Grocers, Chemists, Confectioners, and Corn Dealers.

PAISLEY, DUBLIN,

77A, Market Street, Manchester, and 23, Ironmonger Lane, London.

ALLEN'S PATENT PORTMANTEAUS, AND TRAVELLING BAGS, WITH SQUARE OPENING; Ladies' Dress Trunks, Dressing Bags, with Silver Fittings; Despatch Boxes, Writing and Dressing Cases, and 500 other articles for Home or Continental Travelling, Illustrated in their new Catalogue for 1859. By post for two stamps

J. W. ALLEN, Manufacturer of Officers' Barrack Furniture, and Military Outfitters (see separate catalogue), 18 and 22, Strand.

BROWN & POLSON'S

PATENT CORN FLOUR.

The *Lancet* states: "This is superior to anything of the kind known."

THE most wholesome part of the best Indian Corn, prepared by a process Patented for the Three Kingdoms and France, and wherever it becomes known obtains great favour for Puddings, Custards, Blancmange; all the uses of the finest arrow root, and especially suited to the delicacy of Children and Invalids.

BROWN & POLSON,
Manufacturers to Her Majesty the Queen: Paisley, Manchester, Dublin, and London.

PENCILS! PENCILS! PENCILS!

GOOD STATIONERY, at reasonable Prices,

At G. BLIGHT'S, 168, Fenchurch Street, London, E.C.

WHAT A NUISANCE!!!

There's the point gone again, just in that fine outline, too;
AND THE GRIT!!! Oh, what *shall* I do?
I *must* try those Gilbert's Pencils that Blight sells.
Let me see, it's G. BLIGHT, General Stationer, 168, Fenchurch Street, London, E.C.

And he sends a set of six different shades, post free, for Eighteen Postage Stamps.

GLENFIELD PATENT STARCH,

Used in the Royal Laundry,

And pronounced by Her Majesty's Laundress to be the finest Starch she ever used.

WHEN YOU ASK FOR

GLENFIELD PATENT STARCH,

SEE THAT YOU GET IT,

As inferior kinds are often substituted.

Sold by all Chandlers, Grocers, &c. &c.

WOTHERSPOON and CO., Glasgow and London.

UNHEALTHY SCHOOL-ROOMS.—This year's reports of the inspectors of schools contain a number of representations upon the subject of the bad ventilation of the school-rooms they have to visit. "I very seldom enter a school-room," writes one, "of which I can say that the air is without taint;" and he notices the great amount of illness he has found among teachers in his district, and says that the health of some students in training in schools remarkable for want of ventilation has quite broken down. "The pupil teachers," says another, "almost invariably suffer from ill-health when the rooms are improperly lighted or imperfectly ventilated." One of the inspectors is struck with the number of deaths among these young people. School-rooms, being meant to hold as many children as possible, require a large and regular supply of fresh air, and exit for the impure; and Dr. Pidduck, the physician to the Home and Colonial Training College, maintains that the air in class-rooms requires to be continually renewed, with a view to the instruction producing its due impression. Defective ventilation, he says, militates more against health than close study and neglect of proper exercise. Many school-rooms are heated by stoves, and have no open chimney; and the prevailing fashion of mediævalizing modern school-rooms has caused some to be built with none of the windows made to open, and others with only a small portion, and that partially. A high-pitched roof, if there be no skylight, becomes a reservoir of foul air. Some school-rooms are heated by air from flues, which causes the air of the room to be so attenuated as to lose a large amount of its power to sustain life. As yet no plan of ventilation seems to have been devised equal to an open fire and wide fireplace, with windows so placed as to supply a good through draught.—*Times.*

FIELD-LANE RAGGED SCHOOLS.—On Wednesday, July 18th, the committee and teachers of the above schools gave a day out to Buckhurst-hill to nearly 1,000 of the senior boys and girls and the mothers of the children who attend the free-day schools. The scholars occupied twenty-three vans, headed by 26 fifers and drummers of the Lambeth Ragged School; the mothers were taken down to the same place by special train, *via* Eastern Counties Railway. The day being fine an immense concourse of people assembled in Victoria-street to see the children off, and during their passage through town they were greatly cheered. The extensive grounds of the Roebuck were scarcely large enough to accommodate so large a party, although everything had been arranged in anticipation of the visit. Each child took down its own dinner, and after romping, games at foot-ball, trap-ball, skipping ropes, swings, cricket, donkey riding, &c., they did ample justice to a meal of bread-and-butter, cake, and tea. On leaving the grounds each child received an eight-ounce cake. Nearly four hundred of them had subscribed farthings, amounting to 2*l.* 5s. 2d., in order to enjoy a "ride on a donkey," the anticipation of which had been the dream of their existence for several weeks. The joyousness of their expectation may be imagined when it is known that more than one-half the number had never seen a green field, and the majority were friendless. After a day in which the teachers vied with each other in contributing to the happiness of their scholars, the whole party returned without the slightest accident, the hilarity of the children exciting cheerful responses from large crowds who waited their return at different parts of their route, thus agreably terminating a day which will never be forgotten.

REFORMATORY AND REFUGE UNION.

THE Fourth Exhibition and Sale of Industrial Work from Reformatories, Refuges, Industrial Schools, and Penitentiaries, was held at Willis's Rooms, St. James's, on Wednesday and Thursday, the 6th and 7th of June.

The room was arranged so as to classify the several descriptions of work. The general divisions were—manufactured articles, straw work, cabinet work, ornamental articles, needlework, and trades at work. In these were included the work of turners, smiths, cabinet-makers, carpenters, tailors, shoemakers, brush-makers, printers, and bookbinders; together with mat-making, modelling, paper bag making, wood-chopping, fancy box making, straw work, plain and fancy needlework, &c., &c. The inmates of some of the institutions were at work in the room, and boys from the shoe-black brigades were also in attendance.

The exhibition was visited, amongst others, by the Duchess of Wellington, the Marchioness of Cholmondeley, the Marchioness of Exeter and Lady Mary Cecil, the Marchioness of Westminster, the Countess of Gainsborough, Lady Calthorpe, Lady Egerton of Tatton, Lord and Lady Radstock, Hon. Lady Stopford, Lady Hugh Campbell, Lady Anne Wilbraham, Lady Isabella Whitbread, Lady Portman, Lady Charlotte Denison, Hon. Mrs. Locke King, Hon. the Misses Waldegrave, the Hon Frederick Byng, Mrs. Evans, Mrs. Shand, &c.

On the evening of the 6th a *conversazione* was held in the large room; the Earl of Shaftesbury occupied the chair.

The Rev. William Chalmers commenced the proceedings with prayer.

Mr. Robert Hanbury, M.P., one of the hon. secretaries, then made a general statement of the position and progress of the Union, embodying the substance of the fourth annual report. He referred to the statistics there given as to the number of institutions throughout the country, and to the reduction, amounting to 26 per cent. in two years, in the number of juvenile offenders committed to prison. The principle of all these institutions was, he said, first to teach their inmates the saving truths of the Gospel, basing all their teaching on the Word of God, and next to train them to habits of industry. It was gratifying to add that in most, if not all of them, a very great improvement was visible within the last few years.

The Rev. Wm. Brock dwelt on the advantage of preventive over reformatory efforts, pointing out that the only true principle of reformation or prevention was that which struck at the heart, and that it was only as the heart within became a new heart, that the life without would become a new life.

The Earl of Shaftesbury expressed his deep sympathy in the movement, and his conviction of the vastness of the benefits which it conferred on the nation, not only by the prevention of crime, but by the training up to honest and godly lives those who but for it would have been criminals. He should be glad to hear that the number of Reformatories and Refuges had been reduced one-half, on the ground that the necessity for them had ceased. He wanted to see a great extension of industrial schools, because they constituted the best preventive system. This system was now on foot, and if carried into effect with sympathy and co-operation, it would supersede, in a very short time, the reformatory system, the gaol, the gaoler, and, in many instances, perhaps the hangman. He had just been informed by the chaplain of Parkhurst, that in that great gaol for juvenile criminals, which was built to accommodate 650 inmates, and which sometimes had 720, there were at this moment only about 300 in the prison—not from any deficiency in accommodation, but because juvenile criminality had so largely diminished of late years. They had a right to attribute that fact to the influence and operation of such refuges as those which had already been described by his friend Mr. Brock; but he would go further, and say that it was also owing very largely to the institution of Ragged Schools, which had reclaimed tens of thousands of our outcast and helpless children from vice and crime, and made them now an honour and security to the country. He referred to the great diminution in the number of juvenile offenders brought before the police magistrates as practically illustrating the beneficial effect produced to society. He then adverted to the preventative efforts made among adults, and to the necessity of increased effort among the classes of outcast women.

The Right Hon. Joseph Napier observed that crime cost this country 10,000,000*l.* annually. The germ of the reformatory system was embodied in the inspired precept, "Overcome Evil with Good;" and what in fact was the whole Gospel but a Reformatory system, applicable not only to removing the guilt, but to destroying the power of sin. He earnestly seconded the observations of Lord Shaftesbury as to the necessity of greater efforts to benefit and elevate females, and appealed to the ladies present to give personal help in this work of social progress.

After an interval for refreshments and the inspection of the exhibition,

Mr. G. H. H. Oliphant delivered a brief address on the operation of the Industrial Schools Act in meeting the case of juvenile beggars. He expressed an earnest hope that the provisions of this useful Act might become more widely known and carried out.

Mr. J. R. Fowler made some remarks in reference to the Shoeblack Brigades, and the proceedings of the evening were then brought to a close.

On the evening of the 7th a second *conversazione* was held, attended by nearly 700 of the practical workers in the Reformatory enterprise, Ragged and Sunday School teachers, members of the Young Men's Societies, managers and officers of the Refuges, and others. Tea and coffee were served throughout the evening, and the company were entertained with selections of music admirably performed by the three instrumental bands of the East London Shoeblack Society's Refuge, the Boys' Refuge, and the North West London (Euston-road) Training School.

The business proceedings were commenced with prayer by the Rev. L. B. White.

Mr. R. Hanbury, M.P., who presided, expressed the pleasure which the committee of the Union felt in meeting that evening those practically engaged in this great and noble cause. The present prosperity of these institutions was, under God, greatly attributable to the exertions of those he was then addressing.

The Rev. A. W. Thorold, Rector of St. Giles's, delivered an address to the teachers, giving some valuable counsel to those who are practically engaged in conducting Refuges and Reformatories.

Brief addresses were subsequently delivered by Mr. G. J. Bowyer, Mr. W. J. Maxwell, Mr. Charles Ware, Mr. G. E. Cawley, of Manchester, and Mr. A. O. Charles, Secretary of the Union.

The proceedings closed with the national anthem, performed by the brass band, and sung by the audience.

CERTIFIED INDUSTRIAL SCHOOL, PARK ROW, BRISTOL.

THE first inspection and examination of the boys in this school was made a few weeks since by the magistrates of the city, accompanied by a number of ladies and gentlemen interested in the welfare of the class for whose benefit such schools are designed. The whole aspect of the premises, within and without, bore satisfactory witness to the care of the master and the well-doing of the boys, and the examination in the school-room was as gratifying as the inspection of the gardens and workshops had been.

After the examination a meeting was held, under the presidency of the Mayor, and the certificate of the school, signed by the Vice-president of the Council of Education, was read. Miss Carpenter then reported the progress of the school, and suggested considerations how to extend its benefits, in the following address:—

"Mr. Mayor and Gentlemen,—I should not have ventured to request the sacrifice of your valuable time in the inspection of this small school, were it not for the sympathy you have expressed with the object for which it is established, and be-

Digitized by Google

cause I deemed it right to invite your examination of the progress made by the children whom you have yourselves committed to our care. I hoped, too, that your own attention being drawn to the subject, you might devise means for making the school more extensively useful to the city. You would probably hardly recognise, in the scholars you have just examined, the young boys who appeared before you on the Bench, ragged, wild, and miserable. You have seen them at the present time orderly, well-conducted, and happy, gaining useful instruction, which they now know how to value; and you have witnessed the fruits of their industry, proving that they have not only been diligently employed, whereas they were formerly spending their time in idleness, but have been taught skilled labour, and are preparing, at a fit time, to become respectable members of society. Nine boys were sent here by you; the six others who were not sent by the magistrates, but received as volunteers, were in an equally untaught, and, with one exception, wild condition. Two only of the whole number were without any parental care; the larger proportion were under the charge of a mother only, who, being obliged to toil for her daily bread, had no means of exercising due control over the boy; the others, from various causes, were quite unmanageable in their homes, and were leading a lawless life. It was not, then, as an act of charity that these boys were received into the school, but to rescue them from a life of vice into which they we falling, and society from the burden which, as criminals or paupers, they would be to it. Now, though it is true, as Mr. Thompson, of Banchory, truly remarks, in his excellent work on 'Punishment and Prevention,' that 'the object is not here to save money, but to save the child; yet, happily, however, it is true economy to save the child. Viewed in the light of merely worldly advantage, a few children rescued from a long career of depredation and vice amply repay a long expenditure. Viewed in the light of eternity, no money cost can be counted too great to save even one never-dying soul from perdition; and to this glorious end does God often largely bless the judicious expenditure of earthly means.' But it was not simply to rescue a few children, important as that object is, and worthy of much sacrifice of time and means, that this school was established. It was to carry out the wise intention of the Legislature to put a greater check than has hitherto been done upon juvenile crime, by arresting 'vagrant, destitute, and disorderly children' before they became criminal, and making 'better provision for their care and education, by the extension of Industrial Schools.' I quote the words of the title of the Act. And it was proposed to do this by combining magisterial authority with private benevolent effort, this last kept in check by inspection by the Committee of Council on Education. We now know that these 'vagrant, destitute, and disorderly children' exist in great numbers in Bristol, especially the latter, who are often outlaws from the various schools, and permanently infest the streets, causing great annoyance to the regular attendants at the schools, besides growing up themselves in vice. Most of those boys whom I have questioned at Kingswood or other Reformatories say they were drawn into crime by such lads as these, 'bad companions,' as they call them. Now, it was to put a general pressure on these 'idle and disorderly' children that this Act was passed; these being taken from their evil ways, a stimulus and warning would be given to others to attend the numerous schools open to them; the numbers of juvenile criminals, which have been diminished more than one-half since the reformatory efforts of Ragged Schools and other agencies have been directed on them, would be still further decreased, and the police courts would not, as now, be so frequently troubled by the appearance of young boys pefore them. It was to carry out so important a principle that Mr. Chapple, now a rich merchant of Liverpool, purchased these premises to establish such a school in his native city, and Mrs. Evans, a lady of London, contributed 200*l.*, which maintained the school during the first nine months. While we trust that the year now completed has produced its ample fruits in the improvement of the children subjected to the school influences, and has satisfactorily demonstrated the importance to the city of the object contemplated by the Act, yet it has not done its work in grappling with the existing evil. Numbers of young outlaws infest the very vicinity of the Ragged School in St. James's Back. Mr. Turner, the excellent master of the Red Cross Street British School, at a recent meeting of the Western Union of Teachers, complained of the bands of such children who haunt the whole vicinity of his school, and exercise an injurious influence on his scholars. Other teachers, in different parts of the city, made the same complaint. The police are well aware that there are many gangs of juvenile thieves existing in the city, who are continually luring on to their own destruction the 'idle and disorderly children.' This school contains only nine of these, and it might hold fifty. Knowing that the Bench have from the first expressed a full sympathy with the object of the movement and the intention of the Act, and that they have already sentenced a number of boys to the Pennywell Road Industrial School, the master of which has made efforts to find such vagrant boys and bring them before the magistrates, it would appear that the police have not yet made decided efforts to find and apprehend those boys who are known to them as leading a vagrant life, when committing some tangible act. It is not a simple misdeed which makes a boy fit for such a school, but the fact that he is habitually idle and disorderly, as stated in the Industrial Schools Act. Again, many of these children, and perhaps the very lowest class of them, are in receipt of outdoor parochial relief. They may be enjoined by the guardians to attend school; but the simple injunction is unavailing to enable the child to resist the many temptations which beset him. The ordinary allowance of 6d. and a loaf made to the mother for her child will not alone sustain him, still less lodge and clothe him; she must seek some occupation to eke out a livelihood, and in doing so she leaves her children in the streets; they become idle and lawless; some are induced, perhaps, to attend a Ragged School, but their attendance is very irregular. Four of such children, over whom I had acquired some influence, are volunteers in this school—this trifling allowance being, at the request of the mother, paid to its funds; they are all going on well, and have made great improvement, morally and physically, since they first came. Now the Act provides for such cases, and, in clause 21, allows the guardians of any union or parish to contract with the managers of any certified industrial school for the maintenance and education of any pauper child. We are willing to receive into the school any such young vagrant out-door pauper boy, whom the guardians may like to send, on payment of what would be his cost as an indoor pauper. Such a course has for many years been adopted at Norwich with great success; and lately many unions near London have availed themselves of the provisions of the Act, in connection with a girls' certified school, at Brockham House, Reigate, Surrey. There is yet another class of children, for whom, I fear, neither the magistrates nor the guardians can do anything. Many parents have applied to me in extreme distress about young boys, whom they were perfectly unable to keep from the influence of the 'bad companions' of whom I have already spoken. They felt the importance of removing them, and placing them under steady control; and expressed a willingness to pay something towards their maintenance. Knowing by painful experience how fallacious such promises always are, and therefore requiring that payments for any volunteers should be made in advance, which they were not prepared to do, I have very reluctantly declined these cases, unless there were a magisterial commitment, and the power of enforcing payment. Perhaps you will kindly advise me in this matter, and inform me whether you can thus, on the application of a parent, *commit* a child to the school. To one point I must now advert, in which, I regret to say, there has been an omission of duty on my part. It was an important feature of the Act that parents, by neglect of the duty of controlling their children, should not be relieved from the responsibility of maintaining them. A provision to secure this was made in the Act. In one case only of the nine boys committed has any payment been made. Continued applications have been made to the parents, who could pay and ought to pay something, and threats of application to the magistrates have been made. This has not yet been done; it has appeared to me, and the same is generally felt by managers, so inconsistent with the position which we hold towards the children, and likely to be so injurious to it, for us, who have the charge of them personally, to appear in a court of justice against their parents, that I have shrunk from thus doing harm to the school. On this matter also you will kindly advise me. The report which has already been laid before you will prevent the necessity of detaining you with any further remarks, though I shall be most happy to enter into any explanations which you may desire. I hope that the Government of the city will approve

Digitized by Google

of the efforts here made to form honest, self-supporting citizens, as well as to check juvenile vice, and they may be assured of our desire at all times to comply with their wishes, as well as to strive, like our Great Master, to rescue these young ones from perishing."

Some discussion of the difficulties mentioned by Miss Carpenter then ensued.

Mr. H. O. Wills inquired whether or not a plan might be adopted, whereby, if respectable guarantees as to the payment of the money were given, lads whom it was desirable to introduce to such schools might thus be admitted. Such a method might, perhaps, get over the difficulty.

Miss Carpenter replied that she would willingly admit any lad with whom she could have a respectable guarantee for the payment of three shillings a week, the sum paid by the Committee of Council for each boy committed by the magistrates.

Mr. Commissioner Hill referred to a copy of the Industrial Schools Act, which he had with him, and inferred from it that vagrancy, as a ground of committal to an Industrial School, might be applied to the case of boys living about the streets without lawful occupation or settled home, and a boy might thus be rescued from this course of life before the commission of actual crime. He admitted there was at present no legal remedy for the difficulty of parents who knew their children ought to be placed in such schools, but were unable to coerce them to entering them, stating that in America parents were enabled to meet this by charging a child with "stubbornness" before the Bench. He concluded by moving, "That this meeting considers that, in the large benefits to society which Certified Industrial Schools would confer, by being enabled to receive the majority of the lawless and vagrant children now inevitably maturing for violence and hardened crime, and training them into self-supporting, useful citizens, these schools have strong claims for the voluntary aid of the community."

THE SATURDAY HALF HOLIDAY.

An influential meeting of West-end and other tradesmen favourable to this movement was held on Tuesday, July 10th, at St. James's-hall; Mr. Pearce, of the firm of Halling, Pearce, and Stone, in the chair. Among others present were Mr. George Edgar, of the firm of Swan and Edgar; Mr. P. P. Daniell, of Bond-street; Mr. Graham, of the firm of Jackson and Graham; Mr. Hicks, of the firm of Shoolbred and Co.; Mr. Jay, of Regent-street; Mr. Debenham; Mr. Nicholl, of the firm of Harvey and Nicholl; Mr. Hayman, of the firm of Youngman, Hayman, and Burnet; Mr. Hitchcock, of St. Paul's Churchyard; Mr. Grant, of Oxford-street; Mr. Spence, St. Paul's; Mr. Locke, Regent-street, &c. Mr. Locke read the report of the committee, which referred to the progress of the movement, and stated that since the late meeting, at which Lord Elcho presided, conferences had been held among the West-end tradesmen, and a committee formed to carry out the proposed plan of early closing. A considerable number of tradesmen had fallen in with the movement, which had also received the co-operation of the public. It was further stated that the object of the meeting was to obtain on the part of the committee the approval of their brother tradesmen throughout London to the step proposed. The originators of the movement did not wish to do anything that might possibly be considered invidious, or in any way tending to cast reflections upon those who did not quite agree with them in the matter. They had no wish to dictate to others, but, having made up their minds to a certain course, they desired to have the approval of the general body of tradesmen, and with that view the meeting had been called. The committee believed that the object they aimed at would tend to the comfort, the health, and the happiness of a large and deserving class, that they would help forward the rifle movement, so popular at the present time, that the result would further tend to the better observance of the Sabbath-day, and that they would give satisfaction to customers in general without lessening the amount of business done. They believed also that the boon thus bestowed upon young men would be appreciated by them, and the time thus granted be well employed. Mr. George Edgar moved the first resolution, as follows:—

"That a strong feeling having been expressed in various ways by the public, and by a large number of influential persons, especially those interested in the rifle movement, that shops should close, and that business should cease in future at an early hour on Saturdays, and the example having been set by a large number of city houses, banks, public offices, &c., and also by many at the West-end, as well as by nearly all the leading houses in Liverpool, Manchester, and other large towns, it is the wish of this meeting that shops throughout London generally should close on Saturday afternoons not later than five o'clock in summer,—that is, from Lady-day to Michaelmas; and four o'clock in winter, or from Michaelmas to Lady-day." Mr. Daniel seconded the resolution, which was carried unanimously. Mr. Graham moved the second resolution:—

"That a list having been published of some who are willing to close at the above hours, this meeting trusts that tradesmen generally throughout London will fall into the proposed plan, to commence on the 1st of September next, by which day employers will have ample time to prepare their customers for the change, and to make all necessary arrangements to carry it into effect."

The speaker stated that he viewed the question in a practical point of view, and, though he had not been without some doubts, he yet considered it practical, and believed that much good might accrue from the movement. It had recently through the rifle movement gained a large accession of support, and when he saw the number of representatives present from the most influential West-end houses, he had little doubt but that increased progress would henceforth attend it. He was convinced that if public feeling went along with them they might close at four or five o'clock with advantage. Mr. Hicks, in seconding the resolution, observed that the meeting was not connected with the Early Closing Association, but was a meeting of West-end tradesmen. They required time for improvement and recreation to maintain their position with the advance of society, and so long as houses remained open the public would visit them, but no inconvenience would result to either party from the hours being limited. Mr. Hitchcock, in supporting the resolution, stated that, although he did feel offended at his not being invited, together with the representatives of other East-end houses, to take part in the preceding meeting, he yet felt that from his being deeply interested in the matter it might have been so, and therefore, though not agreeing in the way in which the movement had been carried on, he at the same time cordially agreed to the resolution before the meeting. He believed that the boon of more leisure time was as necessary to employer as employed. He proceeded to read a copy of resolutions agreed to at a meeting of warehousemen held on the 6th inst. in the Hanover-square Rooms, soliciting an earlier hour than that proposed by the meeting. He thought that while the movement might not, as was conveyed by the resolution, become general at first, if the more extensive houses led the way the others would follow. He was not aware of any member of the trade in the city, with the exception of a neighbour of his, who had adopted the proposed plan. He had, however, made up his mind on the matter as a point of duty, and, though he stood alone, he would close his establishment at the proposed hour. Mr. Hayman also supported the resolution, and wished that the result of the meeting might be extensively advertised, so that business houses in the remoter districts of London, whose principal trade was frequently on Saturday evenings, might not be injured, if willing to fall in with the movement. Mr. Locke replied that they had considered Mr. Hitchcock to be entirely with them from the origin of the movement. It was not thought that the plan proposed would be universally adopted; all that was wished at present was that it should include all the houses in the principal streets of London. The resolution was carried unanimously. Mr. Knight moved the third resolution,—

"That advertisements be put in all the leading daily papers embodying these resolutions, and that a committee of tradesmen—the names already published to form the nucleus, with power to add to their number—be formed to collect subscriptions and defray expenses to carry out these proposals."

Mr. Jay, in seconding the resolution, stated that he considered the trade to be now in a more healthy state than it had previously been in. No one now thought of dressing his windows on purpose to do an evening trade. He was not unfriendly to the Early Closing Association. He believed it had been of great service, and that but for it and the exercise of a little pressure from without he doubted whether the meeting would have been held. He was favourable to closing at two o'clock on Saturday, but he was afraid that such an hour was impracticable. He believed that much good would result from the movement. Mr. Samson, of the Lowther-

Digitized by Google

arcade, supported the resolution; as a Frenchman who had been twenty-two years resident and engaged in trade in England he was happy to tender his support to any means calculated to promote the volunteer movement. The resolution was carried unanimously. Mr. Nicoll proposed a vote of thanks to the Chairman, which was seconded by Mr. Tarn, of the Borough, and carried, when the proceedings terminated.

THE QUEEN'S COLLEGE FOR THE GENERAL EDUCATION OF LADIES.—The annual meeting of the supporters and friends of this college was held on July 4th, in the hall of the college, Harley-street, the Bishop of Oxford in the chair. The attendance was numerous, and consisted principally of ladies, including the pupils and their friends, together with the professors. Among others present were the Bishop of New York, Sir J. Lacaita, the Rev. E. P. Eddrup, the Rev. H. W. Burrows, &c. The report intimated that no change had taken place in the education staff of the college since the last annual meeting, and that the council had gained, in the Rev. J. Lonsdale and the Rev. H. W. Burrows, a valuable reinforcement. The hopes which were expressed in the last report as to the financial prospects of the college have been abundantly fulfilled, and the council have been enabled to apply a surplus towards the formation of a reserve fund. The following table will indicate how far this prosperity is due to an increase in the number of pupils in attendance:—

	Mich. Term.		Lent Term.		Easter Term.	
	1858	1859	1859	1860	1859	1860
Scholars in College and School	12	15	12	15	14	15
Free Pupils from G.B.I.	13	13	13	14	13	13
Other Free Pupils ...	3	4	2	4	3	5
Compounders	53	53	62	74	45	67
Non-compounders ...	80	84	102	107	75	108
Schools	21	19	19	18	16	21
Total...	182	188	210	232	166	229

The committee look with satisfaction on the steady progress which these figures indicate in the attendance of compounders, who, from their entering more entirely than other pupils into the course which the college has marked out for them, form, through their numbers, the best estimate of the extent to which the college does its work of raising the education of Englishwomen to a high standard, and of the degree of public confidence which it has already gained. The committee have been enabled, during the past year, without encroaching on the time due to other studies, to give three hours instead of two to the classes in drawing, and the pupils have been provided with a larger supply of casts and models. The result has been that the efficiency of the class-teaching has been very materially increased. Accommodation is now provided for receiving boarders. The library is also, though somewhat defective, a very serviceable addition to the college, and the number of people who subscribe to it is yearly on the increase. Next, however, to the charter of incorporation, the most important fact in the past connection of the college is the foundation of scholarships, giving a free education in the college. The first step in this direction was taken by her Majesty, whose interest in the work was shown at an early period by a donation of 250*l.*, and who exercises from time to time the right of nominating a free pupil. The Professors contributed 1,500*l.* towards the expenses of the charter, and at the commencement of the separate existence of the college obtained from the council, in return, the foundation of four scholarships annually, for senior and junior pupils respectively. The chairman, in addressing the pupils present, expressed the pleasure he felt in saying a few words for their encouragement. It was very satisfactory to all interested in the prosperity of the institution to find that, while many other institutions were in pecuniary difficulties, its particular difficulties had been got over, and a satisfactory surplus obtained. This was due, in a considerable measure, to the conduct of the Professors of the college, in setting apart a portion of their annual income to this object. His lordship concluded his address with a reference to his own university life, and in a very cordial manner wished that the favours received, the sympathies awakened, and the friendships formed by those hearing him, while engaged in their present duties, might continue to increase the happiness of their after lives. The adoption and approval of the report were duly moved, seconded, and carried, and the proceedings terminated in a vote of thanks to the chairman.

SMALLPOX AND VACCINATION HOSPITAL.—A general court of the governors of this institution was held on Friday, July 6th, at the hospital, Highgate-hill, Upper Holloway, Mr. Samuel Turner in the chair. Since the foundation of the hospital, in 1746, it has afforded relief to 273,699 patients; during the year 1859 to 1,185; and during the past six months to 669, being the greatest number admitted for a similar time since its institution, and several were refused admission for want of accommodation. Under these circumstances it was resolved at the last general court, that in consequence of the frequent return of epidemics of smallpox, and of the crowded state of the hospital, steps should be forthwith taken to provide a separate building, or wards, to receive the more urgent cases, and thus afford additional accommodation to the public, and security to the patients. In accordance with this resolution, applications for plans and estimates were made, and eventually a tender accepted from Mr. John Perry for building two additional wards to the hospital for the sum of 3,358*l.*, and these wards are to be proceeded with at once. 147,734 persons have been vaccinated at the hospital since the year 1799, and 197 during the last six months, and 120 medical practitioners have been supplied gratuitously with 600 charges of vaccine lymph since the commencement of the present year. The receipts for the year 1859 were 2,680*l.* 15s. 7d., and the expenditure 2,210*l.* 18s. 3d., leaving a balance at the bankers of 469*l.* 17s. 4d. The committee thankfully acknowledge the receipt in donations of 453*l.*, but regret that, while the claims on the hospital have been greatly increasing of late years, the subscriptions and annual contributions are decreasing. They therefore earnestly entreat the support of the public in favour of the Smallpox Hospital, which affords an asylum and refuge to patients who are excluded from other hospitals. The report having been received, and some routine business transacted, the proceedings terminated.

SANITARY LECTURES.

THE Ladies' Sanitary Associations' fourth course of lectures was commenced at the South Kensington Museum, on Wednesday, July 4th, with a lecture on "Industrial Employments in Girls' Schools," by the Rev. John Armitstead, Vicar of Sandbach.

Mr. Armitstead has introduced in his own parish schools the industrial training which he advocates, and, in the lecture, he stated the results, which appear to be highly satisfactory. The subject of this lecture is one which we deem of great and permanent importance, and we therefore propose to give in our next number a full report, which our present limited space will not permit.

A second lecture, on "Sanitary Defects and Medical Shortcomings," was delivered by Dr. Edwin Lankester, on Wednesday, July 11.

Dr. Lankester stated his strong conviction that very many, both of the prevalent "sanitary defects and medical shortcomings," are attributable to the gross ignorance of sanitary science which exists among us. "Still," he said, "it is a most difficult thing to induce the public to take any interest in the diffusion of this much-needed knowledge. We have no physiology taught in our schools. In girls' schools its introduction is most difficult, and wherever a strong-minded schoolmistress determines to introduce it, she suffers immediately. I know this from experience. I have for many years given occasional courses of lectures on physiology in ladies' schools. On one occasion when I gave such a course I took down a mackerel, just to show the young ladies how fish breathe by means of gills instead of lungs, like human beings, and immediately one of the pupil's mothers wrote to the principal of the school to say she did not 'wish her daughter to attend the lectures on *dissection!*'"

Dr. Lankester expressed his very high opinion of Miss Nightingale's "Notes on Nursing," defended her from the charge of making "rash" or "exaggerated" statements, and earnestly urged his audience to read and re-read her valuable works. With reference to Miss Nightingale's inquiry for an instrument to determine the quantity of carbonic acid gas in the air of sick rooms, he mentioned a method of attaining this object, which we conceive to be very valuable, and easily applicable to practical purposes. "If," said he "we expose a glass of lime water to an atmosphere containing carbonic acid gas, we shall find the carbonate of lime will fall to the bottom. The greater the quantity of carbonic acid gas in the atmosphere of a room, the greater will be the deposit of carbonate of lime. Thus, if we have a large bottle with a wide mouth, filled with lime-water, and expose it to the air in a sick-room, we shall obtain a deposit of carbonate of lime, and according to its quantity we may judge of the quantity of carbonic acid gas. I have tried many experiments, and I find this plan answers best."

Digitized by Google

Dr. Lankester, in the course of some remarks on the fatal effects of bad drainage and uncleanliness in the houses of the poor, gave the following valuable suggestion to district visitors, clergymen, and those who are working for the improvement of cottage homes :—

"There are many fertile causes of disease —such as bad drainage, want of water, &c., which the poor themselves cannot remove ; they are dependent on their landlords. But it should be known that there exists a law (the Metropolitan Management Act) which appoints medical officers of health for every district ; and I think that benevolent people, when they visit the houses of the poor and find that the dust has not been properly removed, or that the walls have not been whitewashed, or the drains not attended to, or that any similar cause of disease exists, cannot do a better thing than at once to report the condition of the house to the medical officer of health* ; because the poor people can do nothing with these things. But the law compels their landlord to attend to drainage, and cleansing, and everything of that kind. This is a most important thing for all people to know who would do good to their poor neighbours. By applying to the medical officers of health, bad drainage, accumulations of dirt, and all similar causes of disease can be removed, and much life saved. There are many religious and benevolent people who visit the homes of the poor, but they too frequently give little attention to sanitary matters. They are not sufficiently impressed with the importance of healthy bodies ; they devote their attention too exclusively to the spiritual condition of the people. But let me express my deep conviction that the sanitary work must receive a greater share of attention before the efforts for the spiritual elevation of the people can be successful. We can do comparatively little good amidst filth and misery. We may talk and talk to a person who is lying ill of a fever, or in a state of chronic disease, but it will too often be in vain. * * * *

"With regard to deficient water supply in the houses of the poor, much may be done by application to the medical officers of health. Think how important the water supply is !

"I have seen a mother of a family living in an attic with five or six children, and having to bring every drop of water from a court-yard below at some distance off. Only think of a poor mother of a family having all that unnecessary trouble, in addition to all her other cares and toil ! And think how that acts. Her children do not get washed enough. Their clothes do not get washed enough. It is impossible for them to be cleanly under such circumstances. We must not go idly talking and complaining of them for being dirty. What must be done is, to influence the proper authorities to attend to the water supply. Well, here, as I said before, the medical officers of health should be applied to. I believe that every vestry has the power of ordering a proper supply of water to every house, and district visitors should be aware of the stringent provisions of the law with regard to these matters, because I believe if it were more generally enforced, it would be the means of effecting an immense improvement in the sanitary condition of the poor."

We regret that our space does not permit a more fuller report of this admirable lecture, which was throughout of a most interesting and useful character. We are glad to learn that the whole of this and of the other lectures in the course will be shortly published by the Association.

The third lecture of the course, on "Healthy Dwellings and Prevailing Sanitary Defects in the Homes of the Working Classes," was delivered by Henry Roberts, Esq., on Wednesday, July 18.

This lecture, which was throughout replete with valuable instruction to all who are interested in that most important part of Sanitary Reform, the improvement of dwellings, is admirably reported at length in the *Builder* of the 28th July. To that report we have much pleasure in referring our readers, contenting ourselves with the following extracts relating to woman's work in Sanitary Reform :—

"If ladies throughout the length and breadth of the land would individually make themselves acquainted with the domiciliary condition of the working people in their own neighbourhoods, and would sympathise with them in their difficulties in this respect, a task vastly more easy than that to which ladies have devoted their time and talents with so much zeal and wisdom, in visiting our prisons and hospitals, the sights they would witness, and the reflections which must arise therefrom, would compel them to exert all their influence in promoting the greatly-needed reform.

"Although the power of aiding directly in the removal of existing structural defects in the dwellings of the poor is not very generally possessed by ladies, their influence may be exerted with the greatest benefit in pointing out to others the necessity for, and in persuading them to carry into operation, those remedial measures which have already been referred to. There is, moreover, a field for the exercise of influence in which ladies may labour, and have done so most efficiently. They can impart instruction, can exhort, encourage, stimulate, and, above all, can manifest that sympathy which shines with such attractive lustre in the crowning grace of Christian charity.

"Amongst those practical duties of which the necessity and advantages may be pointed out to the wives of working men, one of the first in importance is, that she should be 'a keeper at home,' and attend to her household duties as well as to her children ; for without this a dwelling may possess all the conditions essential to health and morality, and yet the occupants be comparatively little benefited by its advantages.

"Ladies can exercise a personal influence by either teaching, or causing to be taught, the benefits resulting from a free admission of pure air, of personal and household cleanliness ; and they can facilitate the obtaining of such articles as whitewash, brushes, and ventilators, as well as the mending of broken windows ; they may also enforce, more especially on wives and mothers, a careful attention to the many details which conduce so much to health and domestic comfort, and render home attractive rather than repulsive, to husbands and sons. They can likewise be instrumental in promoting those habits of temperance which enable husbands to expend on home comforts 'the fool's pence' whereby the publican is enriched, to the impoverishment and incalculable injury of the labouring classes.

"Ladies have, by the bestowment of premiums and rewards for the best-kept cottages, greatly conduced to the health and the comfort of their occupants. They have also exercised a most beneficial influence, through personal intercourse, and what has been aptly called, 'Mothers' meetings,' conducted in a spirit of Christian kindness, with the aim of teaching the poor to help themselves.

"The obligations of the Divine command, 'Thou shalt love thy neighbour as thyself,' have been further recognised by ladies in the organisation and in the personal superintendence of a female agency, which combines a social or domestic mission with the carrying to the dwellings of the masses of our town population that book, in regard to which experience proves that the heartfelt reception of its sacred truths is the best security for a lasting abandonment of those evil ways which debar so many the enjoyment of a 'Healthy Home.'"

The fourth lecture of the course, on "Dress and Social Habits, in relation to Deformity and Disease," was delivered by Ernest Hart, Esq., on Wednesday, July 25. We hope to give an abstract of this lecture in our next.

METROPOLITAN FREE DRINKING FOUNTAINS ASSOCIATION.—On Thursday evening, July 5th, the friends and supporters of the Metropolitan Drinking Fountains Association held a *conversazione* at St. James's Hall, Piccadilly. The assembly was numerous, and was presided over by the Earl of Shaftesbury. Various models for fountains, displaying grandeur of design and beautifully executed, were arranged in the room. The general effect was very brilliant. Shortly after nine o'clock Lord Shaftesbury took the chair, and said he was anxious to enlist the sympathies of the company in behalf of the drinking fountain movement. It might, he said, appear small in its design, but he maintained that it involved consequences of vital importance to the well-being and morality of the population. The issue of the experiment which had been made was most favourable. In Liverpool, within one year, fifteen millions of draughts had been taken from the fountains ; and to secure a corresponding result in London, 400 fountains were required. The association had already erected about 100, and he was sure that those who contributed for the erection of the remaining 300 would afterwards be extremely glad that they had so expended their money. Some persons had no conception of the difficulties which the working classes had in obtaining a glass of pure water. When he had been a member

* For full directions as to the mode of reporting to the medical officers of health, see "The Health of the Parish ; hints on the powers for protecting the poor from the causes of disease." London : Jarrold and Sons, 1860.

Digitized by Google

of the Board of Health, he found that in many parts of London water was more scarce than wine or beer. Such a state of things was not only discreditable, but it was most injurious to the health and morality of the population. The fountains would materially diminish the temptations to intemperance, while they would be beneficial in an artistic point of view. Art had often been prostituted to bad purposes; a devotion to it had sometimes accompanied the decline of morality in a nation; but, in the case of drinking-fountains, art and morality went hand in hand. (Cheers.) Dr. Lankester then delivered a very interesting address on water, and on the particular qualities of the water of the metropolis. He recommended the drinking-fountains to public support, on the ground that the water which they supplied was effectually purified. A short paper on art, as applied to drinking fountains, was afterwards read by Mr. John Bell. The band of the Scots Fusilier Guards was present, and played several favourite airs, and altogether the friends of the Association had every reason to be gratified by the *conversazione*.

THE EMPLOYMENT OF WOMEN.—A *conversazione* of the Society for Promoting the Employment of Women, in connection with the National Association for the Promotion of Social Science, was held at 19, Langham-place, on the evening of Friday, June 29. Lord Shaftesbury took the chair at nine o'clock, by which time a numerous and influential audience had assembled. The chairman, in an opening address, explained and enforced the principles of the society, congratulated the members on the success which had attended their efforts during the first year, and enforced the necessity of still further extending their operations. Mr. Cookson urged law engrossing as a suitable occupation for women, described the office established by the society, which is already supported by several solicitors, and gave an interesting account of the work done there. Mr. Hastings spoke of printing as peculiarly well adapted for women, and read a paper contributed by Miss Emily Faithfull, on the introduction of women into the printing trade. Mr. Mackenzie read a paper by Miss J. Boucherett, on bookkeeping, stating that a want of knowledge of accounts was one great reason of the disinclination to employ women in shops, showing how they might be fitted for the offices of cashiers and bookkeepers, and announcing that a school to supply these deficiencies had been opened by the society. Vice-Chancellor Wood spoke of other occupations for women, and recommended that they should be employed as clerks in post-offices, and as managers of hotels, as hairdressers, &c. He read a paper by Miss Parkes on the same subject, and concluded with an eloquent appeal for further subscriptions. The audience were then introduced into a lower room, where the interesting collection of women's work in law engrossing, printing, designing, &c., was exhibited, and excited much admiration.

Notices to Correspondents.

The Editor requests that any circumstances connected with Charitable Institutions, which it may be thought advisable to bring before the public, may be communicated to him at 337, Strand, on or before the 14th of each month.

NOTICE.

It is requested that Reports of Meetings, Pamphlets, Reviews, or other matter communicated for the benefit or notice of "The Philanthropist" may be forwarded, if possible, to the Editor, on or before the 14th of the month, that they may have the attention to be desired.

Notice.—Subscribers of £1 1s. and upwards to the Reformatory and Refuge Union, 118, Pall Mall, will be supplied on application with "The Philanthropist," a Monthly Journal of Social Economy.

SOCIAL SCIENCE.—III.

IT was suggested in the last article that a State adequately organised for true civilisation would ascertain the proper limits and objects of legislation, would then arrange the laws it found necessary to promulgate in a concise and intelligible shape, and would further take care that the judicial administration of those laws should be so conducted as to make justice accessible to every citizen. The validity of these propositions will hardly be challenged; and in proceeding to another branch of our subject it may be asked with equal confidence whether any nation can be justly called civilised which does not provide, in some shape or other, for the mental and moral training of every child born in its population? The national duty of such provision was fully recognised by the Greek States of antiquity; it is partially admitted in theory by every Christian country at the present day; how far it is fulfilled in our own we will briefly consider.

Taking education in its true sense, as the training of the whole faculties of the man for the duties that lie before him in life, it must be admitted that the English upper classes are better educated, or at any rate have better means for education, than those of any other country. Making all due allowances for the shortcomings, still observable though much diminished of late years, in our universities and public schools, there are still no institutions in the world comparable with them for a wholesome union of discipline and freedom, of physical and intellectual training. Wellington once said that the battle of Waterloo was won at Eton, meaning that the hardihood of those classes in which the pith of the national strength is to be found has been nurtured by a public school system. That system has been widely spread over the country by means of the numerous foundation schools in which the sons of the upper and the wealthier portion of the middle class have for generations been educated. The increase of these schools has been coincident with the advancing enterprise and enlightenment of the nation, by far the greater part having been founded since the Reformation and during the rise of the national commerce and colonisation. In the present generation the movement has taken a new form in the establishment of numerous proprietary colleges and schools. It is unnecessary to observe that the excellent instruction afforded by these institutions, as well as by a host of private teachers, is wholly independent of Government support.

Descending a step lower in the social scale, we find the state of the genuine middle class schools far from satisfactory, though the formation of separate commercial classes in the foundation schools of our large towns, as in Liverpool and Birmingham, has done much to mitigate the evil. But the general inferiority of commercial instruction, not only to that of public and grammar schools, but even to the teaching of national schools, is a serious evil; and the more so that the sons of tradesmen are sent into the world of business at an earlier age than those of the upper classes, and consequently require even better training during the time they can get it. This tendency to a shorter term of education, in proportion as you descend through the different ranks of society, was well pointed out by Mr. Adderley in his address last year to the Social Science Association, and the fact is so plain, and in the present state of society so inevitable, that the wise

Digitized by Google

man will accept it as such, and endeavour by improved appliances and better teaching to make a little time go as far as possible. In respect to the average commercial schools of England, there is at present an almost unlimited field for such improvement, the masters being generally unskilled, the appliances for education extremely defective, while the prejudices of the parents, owing to their own wretched training, are frequently a bar to any attempted improvements. Some remedy has been applied by the movement already noticed in many of the foundation schools of the country, which have adapted themselves to the wants of the trading class; but a wider cure will probably result from the University Local Examinations, affording, as they do, a test of school efficiency and a standard of intellectual acquirement. But if the education of boys in middle-class schools is defective, what are we to say of the teaching which girls in the same condition of life are in the habit of receiving? It would be hard to conceive anything more useless, more superficial, more utterly unworthy of a reasonable being, than the thin varnish of showy accomplishment laid over an almost total ignorance of useful and solid knowledge, which forms the result of a girl's education in the present day. Hence the difficulty in obtaining suitable employment for women of the middle class, it being idle to expect that they whose sole training has been an expensive imposture will prove themselves fitted for posts demanding intelligence and trust. How many tradesmens' daughters are there in London who can make out a bill or keep a ledger? how many schoolmistresses who could teach these, probably despised, acquirements? and how many fathers and mothers of that class who even wish their daughters to learn what would make them independent in their future life? Not long since the Society for Promoting the Employment of Women opened a class for the instruction of girls in book-keeping, and a number of young women were willing to avail themselves of the advantage; but it was found that they were so ignorant of the rudiments of arithmetic that it was necessary to begin with instruction which they ought to have received as children. It is absolutely necessary that this want of sound female education should be supplied before the efforts now in progress for the development of female industry can be expected to bear real fruit.

The subject of education is so wide that its further consideration, with reference to the operative classes especially, must be left for a future occasion. It is not without a purpose that the training of the upper and middle ranks has been made the subject of a separate notice, for a protest cannot be too often entered against that narrow and erroneous view of national education which confines the term to the school-teaching of artisans and labourers. National education, if it means anything, means the education of the whole nation, and it might be happier for England if she had some system analogous to those laid down in ancient states, by which all ranks were trained for their civic duties, and all classes cemented together by the bond of a common feeling. This, in our generation at least, is not to be, but we may fairly look forward to the formation of a sound public opinion on the subject of education, which will have the effect of raising the moral and intellectual training of all orders of men among us, of the highest the most high, and thus of preparing each for a faithful and mutually forbearing discharge of the different duties which Providence has assigned to them. There is yet a wide gap between what has been actually done in this direction, and what is possible and even immediately practicable; but there is no need for discontent. Such a movement in this country is necessarily slow, but, once begun, it is certain to go on to the final result.

GEORGE W. HASTINGS.

NATIONAL ASSOCIATION.

THE fourth annual meeting of the National Association for the Promotion of Social Science is fixed to take place at Glasgow on the 24th of September and the five following days, under the presidency of Lord Brougham. In the year 1824 Lord Brougham delivered a great address at Glasgow on the occasion of his installation as Rector of its University. Since that time he has never visited the city in any public capacity, and now returns to it after the lapse of thirty-six years, a circumstance without precedent in the life of any public man. The Lord Provost of Glasgow, Sir Archibald Alison, Bart., and the Very Rev. Principal Barclay, have been appointed Local Vice-Presidents. The Presidents of Departments are as follows: Jurisprudence, the Lord Advocate; Education, Sir James P. Kay Shuttleworth; Punishment and Reformation, the Hon. Arthur Kinnaird, M.P.; Public Health, Viscount Ebrington; Social Economy, Sir James Emerson Tennent. The meeting promises to be of unusual interest and importance. It will afford an opportunity for the comparison of Scotch and English systems of law and education, and of various other points of difference in the social arrangements of the two countries. The local committees are actively engaged in procuring papers in the various departments with the view of bringing out clearly those points of difference. Papers are to be sent in to the Hon. General Secretary, G. W. Hastings, Esq., at 3, Waterloo-place, Pall Mall, London (S.W.), on or before the 1st of September.

LADIES' SANITARY ASSOCIATION.

IT is an old and trite saying, that prevention is better than cure, but with all women have done, and are doing, individually and collectively, to alleviate disease, they have never hitherto attempted any systematised effort for its prevention.

From this "Association for the Diffusion of Sanitary Knowledge" much may be hoped, should it receive that practical support from the influential classes to which its objects are entitled. As the Association is yet in its infancy, and has had little time or opportunity to make itself known, it would be well to explain these objects, and the need the Association has of some aid beyond itself for their furtherance, before entering upon the question of what classes of the community might be "influential" in the work of sanitary reform.

The Association consists of the ordinary machinery of patronesses, committee, secretaries and subscribers; and the purposes to which the funds subscribed are devoted are principally the publishing and circulating of plain, clear, tracts on all subjects relating to the preservation of health and the delivery of sanitary lectures. Other methods of spreading sanitary truths are proposed, such as the establishment of lending libraries, and the formation of training institutions for schoolmistresses and nursemaids; but the funds of the Association have not hitherto been nearly adequate for the carrying out these measures.

But though increased funds are desirable for this, as for any other philanthropic work, it is not pecuniary help only that it needs. When the Association has provided the tracts, it has yet to ensure their circulation, and though by increased funds it might to a certain extent effect this by a system of colportage through paid agents, its object is not so much to establish an independent machinery for mere circulation as to recommend its aims and principles to well-established existing organisations for social improvement, and through them to transmit them to the working classes, for whom they are so much needed.

Digitized by Google

The Sanitary Association does not wish to intrude a new and special agency into the parochial system by which the poor of this country are mainly benefited and ministered to. Itself dealing necessarily with physical and material evils, its tracts are, and must be, strictly devoted to the subjects its name denotes, and if every line of them were written—as we doubt not they are—in the spirit of deepest reverence for the Power of which every human body is a temple, in phrase and form they could not be brought under the head of religious tracts, according to the common understanding of the word. Neither are they "stories," works of amusement, for though many of them are humorously and agreeably expressed, they are not works of fiction but of fact, and thus they fall between two stools; they do not *prima facie* recommend themselves as amusing, and religious workers among the poor too often will not accept them as instructive, because they convey no direct religious teaching.

Now it is just these workers among the poor who are the influential classes in all real amelioration of poor men's homes, and in all practical elevation of working women who make or mar these homes. And these workers are nearly all women, with all that quickness to observe an evil, and that tact to suggest its remedy, which the pressure of petty detail in most women's home lives produces.

District visitors, schoolmistresses, "Bible women," are the people who could spread and explain the principles of sanitary law. They hear all about the ailments of the children, and the troubles of the mother; whether they will or no, they enter the cottage, or the one room, as it too often is, at all times of the day, and in all states of transition between the owner's ideas of dirty and clean; they know who does her best under the circumstances and locality in which her dwelling is, and who does not. They know who want teaching on these matters, and the next step is to know how to teach them.

District visiting is organised in different parishes so differently, and in all so imperfectly, that help from the visitors can only be expected individually, as they may severally be convinced of the truth and importance of spreading right notions of preserving health. But the personal influence of the individual goes far; and for every lady who is convinced of the truth of the sanitary tracts, we may reckon upon some progress for them among the poor. It may be little at first, for habit and prejudice are strong, and poverty stupifies when its pressure is incessant. Could we convince working women that senses diseased with dirt crave stimulants, which a wholesome home would deprive of their attraction, we should do much. Drunkenness is the great drain on the wages often sufficient to maintain a family in decency and health; foul air and dirty skins produce a state of body of little force to resist its temptations.

Schoolmistresses have frequent opportunities of explaining and illustrating all the evils of close rooms and dirty habits. If such among the tracts of the Association as are suited for the purpose were put into the hands of a schoolmistress as occasional reading books for the elder classes, she would have additional opportunity to teach the children how to improve their present and their future homes. If the Association is unable to grant tracts for such a purpose, the price at which they are published through their office makes them procurable by all.

Last, but by no means least, comes the power and province of the "Mission," or "Bible" woman. She is, we apprehend, generally an uneducated, but at the same time an intelligent woman; no great theoriser on the laws of health, but a practical pattern of them in the matter of cleanliness. If she will read the tracts herself, and can enter into them, she is a good advocate to retain; but in any case she is by her agency ready to carry out the instructions of her superintendent, and would carry the tracts for sale as she collects payment for bedding and other physical benefits, when not engaged in Bible work. It is not asking too much for the Sanitary publications to let them be circulated with her ticking and calico. The Association would allow a commission in such cases, in any shape approved by the employer of the paid agents.

With so many channels of communication with the poor already existing, and eligible for the advocacy of sanitary reform, the Committee of the Association feel it would be a waste of funds, and an invidious interference with present charitable systems, to institute a private agency for their work. We hope that all women who are working for the spiritual and social welfare of the poor will read for themselves the publications of this Association, which are issued under an editing committee of scientific men, and may be procured through any bookseller, or at the Association's office, Princes-street, Cavendish-square, where all details of information can be obtained.

Recreation in its Moral Aspects. A Paper read by the Rev. George Hough at a Meeting of the National Association.

RECREATION occupies a very important place in the social economy of mankind. Its influence upon individuals, and upon society at large, whether for good or for evil, is so powerful and extensive as to claim for it a special and very careful attention in all Christian and philanthropic efforts for the social well-being of the community. Its necessity is universally admitted. Experience and observation abundantly prove that continual work depresses the labourer. Even if his bodily powers sustain the pressure, allowing suitable time for food and sleep, the powers of the mind remain undeveloped. Without recreation we lose our natural stimulus and elasticity, and a less amount of work is done proportionable to the time given. We see the wise and merciful provision made for man in this respect in the appointment of the Sabbath. Apart from its highest sacred purpose, as a day of holy rest and worship, the Sabbath bears upon it the impress of infinite wisdom and goodness for our temporal welfare. Foreseeing the labour wherewith man would be compelled to earn his bread, the Creator conferred upon him one day's rest after six days' toil. "The Sabbath was made for man."

Admitting, then, the moral necessity for recreation, does the mode of it become an object of scientific investigation for society at large? We hold that it does so, very decidedly, that the individual and social well-being very largely depends upon its due arrangement and control; that it is therefore an act of Christian philanthropy to study, devise, and execute all suitable and practicable modes for the healthful recreation of man, both in body and mind.

For, in the first place, we see too clearly the injurious effects of *evil* recreation. In every class of society the moral disorder of our nature manifests itself here, more, perhaps, than in any other course of human action. It not unfrequently breaks out, loose and unbridled, in its worst aspects. Labour has a restraining power and influence over the lusts of the heart of man; but, free from such restraint, they take the larger scope for indulgence, unchecked often by any thought of moral consequences. Man wants recreation and enjoyment, and he seeks it in methods most congenial to his taste and disposition. He pursues what he likes. Hence we are not surprised at the fearful amount of depravity contained in the attractions exhibited everywhere, to allure, to stimulate, to gratify the passions. It is the vicious

Digitized by Google

food of the vicious taste; it does not create, but it feeds and nourishes unholy, impure, immoral affections. The heart is naturally depraved, and the gratification. suited to its depravity makes it worse, Every successive act of vicious enjoyment confirms the habit, aggravates the fever, hardens the heart in its own ways. Such, for instance, are the fruits of *grumbling* in every form wherein it prevails in society, whether at the tables and games of the wealthy, or the modes more congenial to the working classes. Such recreations most powerfully excite and strengthen the cupidity of our nature—counteract, and tend to destroy habits of honest industry, and consume within the man by their debasing selfishness all that he possessed of benevolence and sympathy for other's woes. Time, thought, affection, property, peace, all are sacrificed in the maddening excitement, the wild hope of unlawful gain. In like manner, every other form of recreation (so-called) that excites evil passions is not worthy of the name, such passions as envy, pride, discontent, revenge, impurity, cruelty. Barbarous sports of every kind, "that owe their pleasure to another's pain," as bull-baiting, dog or cock-fighting, and others similar, are detestable, encouraging, and gratifying none but the worst tendencies of our fallen nature. Recreations of this character degrade man below the noble animals whose nature he so perverts to the vilest purposes; seeking his delight and worldly gain in their mutual strife, tortures, and death. This is no theory, but sad and awful truth; and all who for purposes of brutal pleasure or sordid gain thus abuse irrational creatures, do so to their own shame, and to the destruction of all the fine sensibilities of their own superior nature.

And what shall be said of the stimulating drinks that absorb so large a share of the money, the time, the powers, the comfort of our working classes? Professedly designed to recreate the strength and spirits of the labourer, their actual effects are intemperance, debasement, with a long train of evils, and the destruction of all that is noble or praiseworthy. We need not stop to inquire whether, under any circumstances, fermented or alcoholic liquors are beneficial. We are now speaking of them as exhibited in the spirit vault, the public-house, the beer-shop; there the temptation is accompanied by every inducement to captivate its unhappy victims. We need no chemical analysis of these liquors; we look at their *effects;* and these, as seen in the drunkard, in his family, in society, tell sufficiently the fearful waste of honour, happiness, and peace, of wealth and energy, at which this miserable recreation is purchased. But can this be recreation? No greater perversion can be made of the meaning of a word. To recreate is to refresh and invigorate. The fruits of intemperance are debility, disease, death. And if some extraordinary constitutions long endure a course of hard drinking, as they would survive hardship, that would crush the majority of our race; they are but the exceptions. The broad rule still remains that the natural tendency of intemperance, gambling, or cruel sports is destructive of human happiness in both worlds. Every means, therefore, that science and philanthropy can devise is urgently demanded to shield that valuable portion of the community, our working classes, from the cruel deception and robbery, whereby under the guise of recreation they are spoiled of their earnings, their strength, their happiness, and their souls.

But what recreations can be placed before them worthy of the name? Such, as relieving the weariness of body or mind, shall invigorate their powers with healthy enjoyment, free from moral injury. Recreation in its purest, noblest form, should elevate the man, and stimulate him for future duties; sending him back to fill up his station in life with renewed cheerfulness, vigour, and usefulness to the community. Then further, the habits of the class we would benefit are to be borne in mind; their occupations in town or country, abroad or within doors; or whatever other circumstances attend them. Healthy and vigorous exercises will develope and strengthen the bodily powers. For this purpose manly games, such as cricket, appear highly beneficial. But let no sordid rivalry, involving pecuniary gain or loss, mar the game. Let it be enough to acquire the fame of superior agility or skill, maintaining the contest with cheerful, harmony subordinate to the higher ends of mutual concord and the active duties of life. Recreations of this nature unite pleasure with exercise, impart vigour and activity to the body, with healthy and cheerful expansion to the mind.

Many plans are already in operation which it may be only necessary to mention. Well-conducted Mechanics' Institutes afford valuable facilities both for relaxation and mental improvement, as well in the order and privileges of the reading-room, as in the advantages of a well-selected library. Such institutes demand the kindly aid of wealthier neighbours, not more in their contributions than in their personal influence. Museums and occasional exhibitions in central towns furnish another and kindred means for enlarging and improving the mind, and encouraging the development of native talent. Not a few of the most eminent men, in various departments of science or of skill, have received their first impulse from some casual incident. What others beheld as a passing pleasure, has become to them a permanent stimulus, awakening their natural powers, and directing them in the course for which they were peculiarly fitted and designed. But independently of such peculiar cases, general results fully prove their beneficial influence on the mind, the taste, the character of our people Let it be expressly added that the high and sacred interests of public morals imperatively demand, that in all exhibitions of painting or statuary there be nothing to offend purity of thought, nothing to excite unholy feelings or corrupt desires.

The facilities of travelling by railways, both in speed and cheapness, are producing great and valuable results upon the country at large. This is especially seen and felt in what are justly called "cheap trips." No doubt they may be abused. They may become excessive for instance—unsettle the mind—encourage a roving disposition—and thus counteract the habit of honest industry. And one fearful abuse of them, that of Sunday trips, cannot be too earnestly deprecated. Not only are the thoughtless and irreligious thereby confirmed in their thoughtlessness, but others of more serious mind are powerfully tempted by many plausible suggestions to avail themselves of the opportunity. To the ardent minds of the young this danger is peculiarly imminent; and once begun, the habit is gradually formed, till the heart and conscience lose all perception of the evil. While, therefore, we hail the advantage of the railway, and of cheap trips especially, as invaluable to the community, we cannot too strongly express our entire repugnance to such as involve, in any respect, a violation of the sacred rest of the Lord's Day. The early-closing movement and the giving of the Saturday half holiday, both afford a valuable time for recreation to the workman, and nullify the plea of necessity for Sunday excursions. It seems highly desirable that public institutions, as the British Museum, Hampton Court, the National Gallery, &c., should be freely opened to the public on Saturday afternoons; and so in all similar institutions throughout the kingdom. Few sources of pleasure, of a temporal nature, combine so large an amount of innocent and instructive recreation.

This subject will not therefore be found

Digitized by Google

of slight moment. The influence of their recreations on the manners, habits, tastes, and general character of a people is very great. If its peculiar modes, like national ballads, are significant of that character, they also tend to confirm and perpetuate it. Of so much the more importance, then, is it to remove whatever is injurious, degrading, immoral, from the public eye, to promote whatever may elevate and purify the public taste, and impart to it a healthy stimulus. These observations especially apply to all matters affecting female purity and virtue, for the daughters of our land are in many respects its peculiar treasure.

Nor may we forget that man is not merely a creature of time; that he is born for eternity. And the interests and happiness of his immortal soul—his future eternal concerns—are of infinitely higher moment than any merely temporal pleasure; for the well-being of his soul must be keep clear of all sinful pleasures, of everything that would pollute and ruin it; for the well-being of his soul let all his recreations be innocent and pure, elevating and ennobling. Let them be such as will send him back to his work fresh and vigorous. The most ardent piety can enjoy such relaxation: and none is fit for man that would render him unfit for communion with his God; while the best is that which most effectually invigorates the moral feelings, subservient to pure and enlightened devotion.

Above all, guard with holy jealousy the sacred rest of the Lord's Day, the inestimable gift of our wise and merciful Creator and Redeemer. And in all arrangements for the due recreation of the people, let a generous sacrifice be made, if necessary, on other days. Whatever benefits the working classes, benefits the whole realm. For the strength, security, prosperity, and happiness of the nation, are bound up, under God, in the pure morals and sound piety of the population at large.

Economic Museum at Twickenham.—This museum, which was commenced at the Society of Arts in 1856, and subsequently exhibited in a state of progress at the South Kensington Museum and the Royal Polytechnic Institution, is now located, for more complete development, in a building erected on the grounds of Perryn House, near the railway station at Twickenham. Orders for admission to this museum may be obtained from the secretary of the Society of Arts, John-street, Adelphi. The museum is open on Wednesdays, between two and five o'clock. All admissions will be gratuitous.

Reviews.

Startling Facts respecting the Poverty and Distress of Four Hundred Clergymen of the Church of England. By the Rev. W. G. Jervis, M.A., Incumbent of East Moulsey, and Secretary to the "Clerical Fund and Poor Clergy Relief Society." London: Edward Thompson, 3, Burleigh-street, Strand, W.C.

How is Clerical Destitution to be Prevented? A Sermon preached in the Church of St. Mary-the-Less, Lambeth, in behalf of the Association for the Augmentation of Small Benefices in the Deanery of Southwark. By Robert Gregory, M.A., Perpetual Curate.

The facts must be startling indeed which authorise the Secretary of a Society whose business it is to verify them, to "boldly say that some thousands of the English clergy have not 100*l.* per annum," while the amount of tithe which is (according to the Report of the Tithe Redemption Society) yearly alienated from parochial use is 1,639,730*l.* Neither these facts nor their prevention may seem to come within the province of this journal, nor are we about to beg for the poorer clergy, or animadvert upon the wealthier. The social question is contained in the following passages of either publication:—

Mr. Jervis says:—

"My object is now, and ever has been from the first year I advocated the cause of the clergy, to agitate calmly, but determinedly, that they shall be paid for their services, certainly as well as men are paid in Government offices. I ask no more and I ask no less. With this boon we shall, as a body, be satisfied. We have a right to ask for this much, and it is the duty of our rulers to grant it to us. A clergyman is educated expensively. He must, as a rule, go to one of the Universities in England, Wales, or Ireland, in order to pass through a certain course of lectures and study before he is ordained."

"I have heard the complaint made that in some parts the clergy are not gentlemen, or sons of gentlemen. It may be so; and if so, the only remedy is a higher standard of remuneration. We shall then, in all parts, see a different order of men for the holy offices of the ministry. Let the poverty of the ministers of the church be made known, let the laity be convinced that their spiritual teachers to the amount of some thousands are worse paid than an upper servant, or the youngest banker's clerk, and I have no fear for the result. They will see that the clergy have their just rights."

Mr. Gregory states:—

"There are already serious grounds for fearing that if effectual steps are not speedily taken we shall cease to have a due supply of clergy. The number of men trained in our Universities, who are willing and able to serve God in the ministry of His church is diminishing rather than increasing, though many more are needed, and the vacant places have to be supplied by others who have enjoyed fewer advantages of education and social position. Few men, comparatively speaking, now dare to enter upon the clerical office unless they have some resources of their own on which to depend for a maintenance."

And to this statement is appended a note containing a table of the number of men ordained deacons during a period of nine years—from 1850 to 1859—which shows that though the *total* decrease of numbers is but nominal, from 622 to 615, yet that the change of educational standard in the sums of that total has been to increase the literates and so to decrease the proportional number of University candidates for orders. In 1850 the proportion of literates to graduates was 88 to 534; in 1859 it was 123 to 492.

To make any distinction or institute any comparison between the two classes of candidates as clergymen, as ministers of religion, is very far from our intention; but in their social position before taking orders there is a difference, and even after those holy orders a distinction will often remain, or be made. Where the exceptional force, moral or intellectual, of the individual, has drawn him from an inferior social rank to that of his fellow-labourers to take his place among them, that same force will maintain, perhaps advance, him in his position. In this, as in every other profession or employment, Englishmen can feel that the lowest born may rise to sit among the highest, if he be fit to rise; and if but one in a million should so rise, yet it elevates the whole million that that one does, and that all might.

But the value of a clergyman taken from the working or lower commercial classes comes from himself, not his order; and if the clergy are to be drawn largely from that order—and that not because more cases of individual fitness occur, but because the pay and position of the clergy is lowering the social standard of their recruits—their influence as a body will decrease, and their own moral tone and intellectual standard deteriorate proportionally. Intellect is taken to market like every other human possession, with this difference, that it sometimes takes itself and its possessor thither, whether the latter will or no. A man may believe and feel that he would not sell his intellect, but his intellect will not allow him to devote himself to a life where that intellect cannot procure honour or remuneration. As high as is the position of a man who gives his life to the elucidating and declaring spiritual truth, so low is that of the mere preacher who lives by his hearers. This

Digitized by Google

s the position to which an ill-endowed clergy are degraded, and this is a position which no gentleman, by birth or education, will endure.

If any proof were needed of the bad effects of lowering a national clergy below the par of the gentry of their country, the Protestant ministers of Germany would supply it.

The German Pfarrer, though in education and intellect often far superior to the noble class who would disdain his calling for their sons, or his alliance for their daughters, is rarely himself admitted to their houses as a social equal; and if he is, his wife and family necessarily belong to their own grade, and have not his exceptional claims to be received into a higher one. Hence his home must be as the home he was born in, not as the home his education would have cultivated his tastes and perceptions to prefer. Simple, both taste and conscience might make it, but refinement would exist with that simplicity. So also in his social intercourses he is out of his own class, while his family remain in theirs —they have their intimacies where he has no companionship—and he has no social equals but his brother clergy. This makes him but a monk in practical judgment of the world around him. If, in spite of his education, he have at heart no refinement above his natural station, he is still less fit for his professional position, for, to satisfy the demands of public opinion upon it, he must more or less seem other than he is. And this obsequiousness to public opinion is deteriorating enough in itself, when the thing sought is simply that opinion for its own sake; add to it any sort of pecuniary dependence, and one can hardly imagine a more degrading position for an educated man, *who knows his own degradation*, which many of the subservient classes do not.

The German Pfarrer has not this pecuniary dependence. He is not thought a gentleman, or required to live as a gentleman; on the contrary, he would be liable to an insulting reprimand from some of his congregation if he did so. He is a married monk without the quiet of a convent, or the sympathy of a home, but his income is held independently, and his wife makes it enough for the daily wants without his thought or care.

The position of an English clergyman has hitherto been the exact reverse of this. He generally is a gentleman; he is always expected to be one, and in all his poverty he feels a certain rest on his position. So long as he respects himself even Mammon does not insult him for his poverty. The reproach which seems cast on the pecuniarily unsuccessful man in every other calling is spared him. He is the social equal of every gentleman in the land, and his family can only cease to be so by his or their fault.

Such has been the position of an English clergyman; individuals have disgraced their calling, but that calling has been embraced by the highest ranks and the finest intellects in the kingdom. But we are a commercial nation, and classes and castes are merging daily, and a monied aristocracy is levelling all others. If clergymen, as such, are not fairly paid, few will take orders in future of that keen-witted and high-couraged class that once sent forth so many candidates from our Universities. Men, sure of preferment, will take orders for the prizes, so long as the prizes are left, but the main body of the clergy will be recruited from an inferior class of men in an inferior rank of life, and the gulf between the two will widen till the perhaps not very distant day when the prizes will be thrown into it by an extended ecclesiastical commission. No doubt a lower ranked clergy could marry and bury the nation as well as the present one, but it is for the educated laity, who have fathers, brothers, or sons now among that order, to consider whether it is for the social welfare of all classes that the social tone of the clergy should cease to be what it has hitherto been.

An Account of the Chorleywood Association for the Improvement of the Labouring Classes. London: Longman, Green, Longman and Roberts. 1860.

This is an agricultural association, near Watford, in Hertfordshire, intended to establish and increase good feeling between the different classes, by the manifestation of a real sympathy from the upper towards the lower. With its results and progress the managers have every reason to be gratified. Before entering upon the report of what the Association has done, and is doing, the account gives a short statement of the principles on which it is conducted, from which two short extracts should be given:—

"Meddling interference is carefully avoided, and on all fitting occasions the labouring classes are reminded that one of the objects of the Association is to teach them to help themselves."

"It is felt also that the managers of such an Association should act on the conviction that the giving of time, trouble, and the results of superior education, are a better form of charity, and a surer means of promoting the welfare of their poorer neighbours, than mere money-giving, and that, especially at the present time, it would be difficult to over-estimate the importance of the upper classes taking and keeping that influential position which their better means of education ought to give them. The managers of the Chorleywood Association feel that it is important, therefore, that on this ground also the gentry should be the prime movers in such an Association, and that the lectures, which, as will be seen, form an essential element of this scheme, should be delivered by them and by their friends, and not by paid lecturers. The legitimate influence of the upper classes must naturally be maintained, and their sympathy with their humbler neighbours increased by such a course; and there are very few paid lecturers who thoroughly understand how to touch the chord of sympathetic understanding in the labouring, and especially the agricultural labouring classes. What is done for hire seldom comes up to that which is done for love."

The Association was formed in 1855. It commenced with providing allotment gardens for the labourers; but as the extent of land available for this purpose afforded but forty-three allotments, it was thought desirable to admit more members by subscription. Members with gardens, about fifteen perches in extent, pay 5s. annually, other members 3s. The next step taken was the establishment of prizes for the best-grown vegetables. This takes place every October, and shortly after a supper is given, which is attended by e members, their wives, and the neighbouring gentry, and it is found that the including the wives at the annual supper has been a successful measure in favour of the Association.

Monthly evening lectures during the winter were next established, and these were so successful as occasionally to collect an audience of two hundred persons. The most popular of these was one given by the Rev. G. R. Gleig, on the "Life of George Stephenson." This so impressed the son of the village blacksmith that he determined to try if he could not make a steam engine of tin as well as Stephenson could make one of clay. He set to work, and succeeded, with little or no help from books, for he was but an imperfect reader. He had seen steam threshing machines in the farm yards, and with these for models he produced at length an engine which worked perfectly. Friends in the neighbourhood interested themselves to place him in some machine factory, where his bent of mind could develope itself. Messrs. Ransome, of Ipswich, have kindly given him employment, and he is doing well.

Associations such as that at Chorleywood will always prosper in an agricultural district, when managed in the spirit of real brotherly love. Country people are keen and shrewd under the dull surface

Digitized by Google

that often makes them appear to an intellectual disadvantage beside the town-bred artisan. Country people have time and space to individualise themselves and others. The squire, the parson, the farmers, all stand out in their separate and several characters, to be liked or disliked as they deserve, or as the rustic judges them to deserve. It is comparatively easy to win the heart and earn the good opinion of those who have opportunities to prove and judge. How to find an equivalent for these fruit and flower shows, social suppers, and hearty sympathy of ranks, which shall find way among the dense masses of town poor, is a more difficult question. How to persuade the sharper-looking mechanic, who is packed among his fellows till he has no individuality left, that he might find truer friends and better advisers among the superiors he views with jealous suspicion than among the equals whose numbers overpower him, is a problem very hard to solve. The educated workman needs no other human dependence than his own arm and brain, his industry and his intelligence; but the masses do need help and direction to follow the simplest laws of well-being. How shall it be best offered to them?

How to Nurse Sick Children. By Charles West, M.D., Physician to the Hospital for Sick Children. London: Longman, Green, Longman, & Roberts, 1860.

This work, addressed to the nurses at the Hospital for Sick Children, and published for the benefit of that Institution, contains much practical information, in a small space, on many of the points most affecting childrens' comfort in sickness, and on which mistakes are most frequently made from ignorance, and over caution. Nursery quackery has certainly lessened of late years. The old-fashioned nurse who administered medicine at discretion,—simple vegetable decoctions no doubt, but uncalled for interferences with nature all the same,—has become obsolete, and in her place reigns the unserviceable looking damsel described by Dr. West. "She was the childrens' maid when they were well, she knows the duties of her place, she is proud of her little ones' good looks, and happy in their love. Illness comes, for few are the nurseries into which, sooner or later, it does not enter; the nurse is unprepared for its approach, she does not understand its signs, she does not know how to lessen its sufferings. She has never made a poultice, she has never strapped a wound, she is afraid to touch a leech; she can do nothing but look sadly on, the most useless person in the household, or at the best can only sit with the sick child upon her lap, vainly trying to soothe it, but in ignorance withholding the drop of water which it craves for, or afraid to wash it, or to change its dress, lest she should give it cold; when, perhaps, the cool drink would have allayed its burning thirst, the sponging would have relieved the fevered skin, and the night would, in consequence, have been passed in quiet sleep, instead of in restless tossing."

Immediately upon this too frequently true picture of a nursery maid's efficiency to nurse, comes the suggestion of a remedy in the training afforded to girls as pupil nurses in the Great Ormond-street Hospital. "Such ignorance this little book is intended to help; but a far better help than this book would be a few weeks passed in the Children's Hospital as a pupil nurse, learning to do at the bedside how to do all those little offices which would make a young woman as useful in sickness as in health. What should we think of the sailor who could manage his ship in fair weather only, but did not even profess to know his duty in a storm, and must then leave it all to the captain? The doctor, like the captain, can only direct; what comes of the patient if the nurse cannot carry out his directions?

Between thirty and forty young women can be trained every year in the Children's Hospital. No other charge is made than suffices to defray the bare cost of their board. On leaving they will receive a certificate of competence, and their names will be kept afterwards on a register by the matron; so that, provided they maintain a good character, they will deserve and command higher wages, get better places, and get them easier than young women who know but half of the duties which are involved in the proper care of children.

But granting the advantages of a training in what Miss Nightingale calls "the handcraft of nursing" in a hospital such as this, there is much to be learnt from the book alone by any intelligent nurse. It is hard to believe that in the case of a children's nurse in a private family the burden of responsibility during illness should be laid upon her rather than upon the mother. As it is, however, to be feared that in many houses such would be the case, too much importance cannot be attached to the education of nursery servants in the right understanding of the symptoms of children's diseases; and however unweariedly a mother may nurse her own child in illness, some help and relief she must have; at such a time the value of an intelligent and unprejudiced assistant would be inestimable. Such an assistant Dr. West's little book would materially help to make of any kind-hearted girl of average understanding.

Durham Refuge for Discharged Prisoners. Eleventh Annual Report for the Year ending April 30, 1860.

This Refuge for the prisoners discharged from Durham Gaol has now been in operation for twelve years.

During the last three years there has been much difficulty in placing the boys in ships, owing, apparently, to some slackness in the demand for ship apprentices. The authorities, however, see reason to hope in the improved aspect of shipping affairs that this difficulty will be lessened shortly. Nothing can be more desirable for boys of this class than the entire separation from old habits and associations which a sea life affords. The decrease in the number of boys committed to prison also promises to lessen the expenses of the Institution.

The Report acknowledges much liberal and valuable support, pecuniary and personal, especially that of the ladies who assist in the care of the girls in the Female Refuge, and in their supervision after they are placed out in service,—a time when it is particularly valuable.

"One favourable feature must not pass without notice. Our accounts show that the sum of 12*l.* 2s. 3d. has been paid to us by parents and relations for the benefit of the children while under our care, or towards defraying the expense consequent on their return home. Of many who have gone from us we receive very satisfactory tidings, and occasionally, as in former years, we are so happy as to hear a report of ground gained in quarters where previous conduct had not encouraged us to look for improvement. It will be pleasing to all the subscribers to the Refuge, as well as to the general friends and well-wishers to such Institutions, to learn that the number of juveniles committed to prison is steadily decreasing, and that the re-committals are much fewer than in former years.

"In 1858, 229 juveniles were committed to the Durham Gaol; in 1859, 187.

"In 1858 and previously, 52 juveniles were re-committed; in 1859, 24."

An interesting table, showing the "Probable Cause" of crime in prisoners of sixteen years of age and under committed in the year 1859-60 is among the statistics of the Report.

Among the eight causes given, "Neglect of Parents" is assigned to 117 out of the 187, and "Distress" to but seven.

There can be no crisis of life where a Refuge is more imperatively needed than when the punishment of the past threatens to cloud the future; and it needs a more heart-felt penitence than prisons are apt to produce, to refrain at such a time from the evil courses and evil company which alone seem open to those whom honest men fe to employ or associate with.

New State Asylum.—The State Asylum for Criminal Lunatics at Broadmoor, on Bagshot-heath, now approaches completion. The site comprises 290 acres, and the land, which is of an undulating character, falls towards the south, and is sheltered from the north and east winds by a belt of wood. There is a stream, yielding from 50,000 to 100,000 gallons daily, of bright soft water. The buildings are erected upon the northern part, from which fine and extensive views are commanded. The Commissioners in Lunacy state that it has been deemed sufficient at present to provide accommodation for 400 males and 100 females, because, although the number of criminal lunatics has for years been increasing, and was 731 at the commencement of the year, and may accumulate through the readiness of juries to admit the plea of insanity, many have been for years inmates of asylums, from which it would be a hardship to remove them. There will be the means of classification according to the condition in life, education and habits, mental taste, and propensities of the inmates. The Government are carrying a Bill through Parliament for "the custody and care of criminal lunatics in an asylum appropriated to that purpose."—*Times.*

Female School of Art and Design, Gower-street.—Some 17 or 18 years ago, partly with the object of opening up a new field for female industry, the Female School of Design was established by Government at Somerset House. It was subsequently, for want of accommodation, removed to premises in the Strand, and for a similar reason, in 1852, to its present quarters at 37, Gower-street. It had been long felt as a crying want that few honourable and profitable employments were obtainable by young women of the middle classes, and it was a happy idea which suggested that this want of employment might be satisfied, and at the same time be turned to the improvement of ornamental design in manufactures, by cultivating the taste of the future designers. The class whom the establishment of such schools proposed to benefit have shown their appreciation of the idea by the way in which they have availed themselves of the benefits offered to them. No less than 690 students have entered themselves at this school since 1852, many of whom, by the instruction they have received, have been able to gain an honourable and competent livelihood. The funds of the Institution were derived partly from fees of a very moderate amount levied on the pupils, but principally by a grant from the Committee of Council on Education of 500*l.* a-year. Just, however, as the school was getting thoroughly up to its work, and extending its influence, the committee have intimated that the grant of 500*l.* a-year hitherto allowed will be withdrawn at Midsummer, and that the school must become self-supporting. This has occasioned the greatest dismay to the supporters and well-wishers of the school, who, however, are making the most strenuous efforts to prevent the closing of the establishment. The greater part of the 500*l.* a-year allowed by the committee was expended in house-rent, taxes, lighting, cleaning, and the salary of a messenger. It is now thought that, if a sufficient sum can be raised by public contributions to buy freehold premises, the school may still continue its present career of usefulness. For this purpose at least 2,000*l.* must be raised, to which sum, if collected, the Committee of Council on Education, according to one of their general minutes, would very probably add 500*l.* more. With no rent to pay, the managers of the school consider that the other expenses, which are not great, may be made up by raising the fees paid by the pupils and by local contributions. In order that the benefits conferred by the present school may, if possible, be still continued, a *conversazione*, under the patronage of the Queen, will be held at the South Kensington Museum on Thursday, the 21st of this month, to aid in raising the 2,000*l.* required. Up to the present moment only about 500*l.* has been collected, and, if the public do not come to the rescue, the school must be closed. In that case the present pupils of the North London district will have either to attend day by day at the South Kensington Museum, or to attend classes where they will be mingled with young men, or to frequent the Finsbury class, which is only open exclusively for women for a few hours during the week. There can be no need for us to point out that a daily walk from Hampstead, or even the neighbourhood of Russell-square, to Kensington is practically debarring pupils from that instruction of which, by the numerous prizes they have won, they have proved themselves so worthy. The indiscriminate mingling of both sexes in classes is conducive neither to morality nor education; and the desultory instruction they would be able to receive at Finsbury would hardly enable them to compete successfully, as they have hitherto done, in the public examinations. On every ground, then, of expediency and morality, it would be better for the public, and especially that part of it which is locally interested, to contribute to the support of this school than to see it shut up. The education given is cheap and good, and purely practical. The establishment deserves the aid of the middle and professional classes, as it especially exists to enable their daughters, if reduced to that necessity, to gain an honourable and competent livelihood. If ever we are to see the restriction of women to the occupations of governesses, shopwomen, house servants, and needlewomen abolished, it is by the encouragement of this and similar schools. As drawing-mistresses, as lithographers, as designers for lace, linen, carpets, papier-mache, glass windows, &c., the pupils of this establishment have been and still are employed. For other reasons, also, this school is a step in the right direction. By extending the employments for women, we do more for the suppression of vice in our large cities than by midnight meetings and sermons. At a time when so much has been talked and written upon the social aspect of the country, it should not be forgotten that the tone of a nation's morality depends upon its women, and the morality of its women upon the education and employment they receive. If women be employed and fairly remunerated, their chief incentive to vicious courses is done away with; and if we wish them to be employed more extensively, and in other departments than at present, it is absolutely necessary that they should be properly educated.—*Times.*

Reformatory Schools.—The annual report of Mr. Sydney Turner, inspector of reformatories in Great Britain, states that the number of boys in these institutions at the end of 1859 was 2,636, and of girls 640; but another school for girls is urgently required. During the year 108 of the inmates emigrated, 57 were sent to sea, 143 were apprenticed or placed in service by the managers, 212 were allowed to return to their friends or were placed in service by them, 102 absconded and were not recovered. Of those who enlist to go to sea a large proportion turn out well; such a life suits the more adventurous and active boys. The majority are not characterised by thorough depravity and love of crime, but rather by restlessness, love of excitement, recklessness as to personal danger, inability for self-control, and facility for being influenced and led by others. Of the whole number (637) of boys and girls discharged from English reformatories up to the end of 1858, above half (333) are known to be living honestly and maintaining a good character. The number known to have been reconvicted of crime is not more than 82, not quite 13 per cent. That is a great practical test of the usefulness of these establishments, and another is their effect upon juvenile crime in general. In 1856 reformatories had got into considerable operation, and the number of commitments to prison of offenders under sixteen has since decreased year by year, so that in 1859 it was (8,913) less by 14 per cent. than in 1858, less by nearly 29 per cent. than in 1857, and less by above 36 per cent. than in 1856 (13,981), while the commitments of older persons, which were 99,755 in 1856, rose higher in 1857 and 1858, and in 1859 were still 98,159. The total expenditure for the year was 72,893*l.*, of which the Government paid for maintenance 51,681*l.*, the parents 1,604*l.*, and 16,169*l.* was raised by voluntary contributions. Mr. Turner speaks very favourably of the condition of the reformatories, and expresses a strong opinion that all young offenders convicted for the second time, and known to the police as living by crime, or as closely connected with criminals, should be committed for long periods to reformatory schools, and thus their career in crime interrupted and their influence in corrupting others arrested. For very young and yet unpractised offenders some short punishment seems more advisable, or committal to a certified industrial school, which is a cheaper and more directly preventive institution, at present, indeed, languishing, but well adapted to save children from sinking into the criminal class, to qualify gradually for admission into the more costly reformatory.—*Times.*

Uncomfortable School-rooms.—We adverted lately to the unhealthiness of some schools; it may be of use to say a word or two against uncomfortable school-rooms, for uncomfortable they may be in many respects—warmth, dryness, elbow-room, sightliness, and all have their influence. It is not necessary to go into the remote north, to such extreme cases as one in

Digitized by Google

Scotland, described in one of the education reports of the year, as having an earthen floor so uneven that it is impossible to steady a chair upon it, the children writing on the forms kneeling on the floor, when this is not too full of puddles of rain to allow of its being done. But there are schools to be met with continually of the description mentioned by an inspector, Mr. Brookfield, where children have to learn the mysteries of notation or orthography while sitting on a high bench with frozen feet dangling above the floor, slate pencil dropping from the benumbed fingers, jacket reeking with rain, not a pennyworth of cinder in the cheerless stove, and all the while a comparatively slight expense, with a little taste and management, might make the parish school as comfortable and as pretty a room in its way as any in the neighbourhood. It is found, says a London school inspector, that night schools to be successful must be attractive. Brilliant lighting, a warm room, and a genial tone about the whole affair are felt to offer a comfortable contrast to the cheerlessness of the cold, wet, and muddy streets.—*Times.*

THE PEOPLE'S KITCHEN.—It is a very humiliating reflection that eating and drinking occupy more of our thoughts than anything else in Heaven above or in the earth beneath. We are not yet as the lilies that take no thought of such matters. Man is like the lower animals in this respect, that with the vast majority of our race the struggle for existence is a struggle for dinner. We have all somewhat of the Tartar Khan in us, and after we ourselves have dined are ready to proclaim that the whole world may dine also. But we first. Nobody shall dine with our good will if we are starving. Who can count all the wars, murders, and quarrels that have arisen out of this one question of dinner—the question of questions? How many of the piteous cases that come before Sir Cresswell Cresswell are to be explained by deficiency of food, badness of cooking, and fits of indigestion? There is no such irritant as hunger and deranged gastronomy. If we could only get at the wisdom which is supposed to lie in ancient fables we should probably find that Pandora's box, the source of every mischief, was an empty oven or larder, or some such receptacle. The poor man especially feels the truth of this doctrine. He conspires against the rich, because he never gets a dinner, and on that point he feels with the Great Cham. He beats his wife, because with his hard won earnings she can place only bad food before him. He drinks beer, and drowns himself in gin, because no meat that he can get is half so pleasant. People imagine that by introducing the light wines of France into this country we shall put a stop to drunkenness. It is a great mistake. The French are a sober people, not because they drink wine, but because they are good cooks. Where you have bad cookery and good liquor, depend upon it the liquor will carry the day; and we shall not stop the rage for liquor in this country by making it still better, by turning the gin into Cognac, and by turning the beer into Bordeaux. The cure lies rather in restoring the balance between meat and drink. Put the meat more on a par with the drink, and then see what the result will be. Either teach the poor man to cook, or give him his meat well cooked. Let the Temperance leagues and alliances look to it. They will accomplish far more good by improving the working man's edibles than by meddling with his potables—by seconding that natural law which makes a man chiefly dependent on his food, rather than by attempting to place artificial barriers in the way of his getting whatever drink he may require. The best cure for the drunkenness of the lower classes is not a Maine Liquor Law, but soup and sausages, pudding and pies; is not to shut the beer-shops, but to open the poor man's kitchen.—*Cornhill Magazine.*

SAVINGS BANKS.—An official return shows that capital held by the savings banks throughout the United Kindom increased from 29,504,861*l.* in 1844, to 38,968,312*l.* in 1859. The capital of the English banks advanced from 25,112,865*l.* to 33,804,682*l.*, the Welsh capital from 599,796*l.* to 968,868*l.*, and the Scotch capital from 1,043,183*l.* to 2,186,848*l.* The Irish capital fell off from 2,749,017*l.* to 2,007,914*l.*, a circumstance which is no doubt to be attributed to the vast emigration which has taken place, and the consequent transference of savings. It is not a little interesting—not to say touching—to note how accurately these institutions reflect the social condition of the masses of the population. Thus, in 1847, when the price of wheat attained a *maximum* of 109s. per quarter, the receipts of the savings banks were only 6,649,008*l.*, while the payments were 9,060,075*l.* Again, in 1848, which was a year of revolutions abroad and Chartism and distress at home, the receipts from depositors were but 5,862,742*l.*, while the payments were 8,653,108*l.* In 1849 the payments exceeded the receipts by 525,877*l.*, and in 1850 there was also an adverse balance of 396,738*l.*; but 1851, 1852, 1853, were years of prosperity, and the receipts considerably out-balanced the payments. War intervening in 1854 again reversed the picture, and a drain set in which continued till 1857. In 1858 the receipts and payments were nearly equal, but last year was evidently one of social prosperity, the receipts having been 9,021,907*l.*, and the payments 7,335,349*l.* But although the total net balances to the credit of the depositors have increased during the last 17 years, this result would not have been attained but for the accumulation of interest; in fact, the actual deposits have not kept pace with the actual withdrawals, the former having been 115,244,139*l.*, and the latter 117,956,454*l.* In England the deposits in the 17 years have been 93,078,220*l.*, and the withdrawals 95,402,441*l.*; in Wales the deposits have been 2,275,779*l.*, and the withdrawals 2,187,814*l.*; in Scotland the deposits have been 10,107,846*l.*, and the withdrawals 9,424,166*l.*; and in Ireland the deposits have been 9,772,294*l.*, and the withdrawals 10,942,033*l.* It is only in Wales and Scotland that any actual progress has been made in the painful process of saving, notwithstanding that the population has in England increased since 1844 at least 20 per cent It says something for the thrifty character of the Scotch, that, with a population amounting to only one-third that of Ireland, they should have actually laid by more money.—*Times.*

AGRICULTURAL SERVANTS.—Mr. Lygon has brought in a Bill providing that no servant in husbandry shall be liable to any punishment for absenting himself from his service or neglecting to fulfil his engagement, "or for any misconduct or misdemeanour in the execution thereof or respecting the same," unless the hiring be under a written agreement signed by both parties, setting forth the nature of the service, the wages, and the period. The wages are to be paid at least every three months. A short form of agreement is given in a schedule, and it is provided that if the service is to be for more than a month, or for an indefinite period, the agreement shall not be liable to stamp duty.

MEETING OF MASTERS AND MATRONS OF REFORMATORIES.—The Committee of the Reformatory and Refuge Union some time ago held one or two meetings of the masters and matrons of Reformatories and Refuges. Considerable advantage having resulted from these meetings, the committee have resolved to invite those connected with the institutions in the neighbourhood of London to a social meeting at the office of the Union once a quarter for friendly conversation and for consideration of any topics of interest to those engaged in the practical working of these institutions. The first of these meetings was held on Tuesday, the 24th of July, and was attended by representatives of twenty-three different Institutions. After tea, Mr. Stephen Cave, M.P., one of the honorary secretaries, took the chair, and commenced by welcoming those present in the name of the committee. He dwelt on the mutual advantages to be derived from such meetings, where the failures and the successes of each might be considered in a friendly spirit, and where all, however good their plans, might learn from what others had done, and be led, perhaps, to feel that they had not alone achieved success. Meeting with others occupying the same position was likely to be beneficial to those who were in the habit of being looked up to in their own institutions, and expecting and receiving implicit obedience. The following topics out of several which had been suggested for consideration were then taken up in order:—1st. The best method of testing vagrancy from misfortunes; 2nd. What are found by experience to be the best kinds of industrial work for boys; 3rd. Is it advisable to allow our inmates out in their leisure hours without a master or assistant in charge of them? In the course of conversation many valuable remarks were made and various opinions expressed, but we have not space to enter into details. Those present appeared much interested in the proceedings, and a resolution of thanks to the committee for convening the meeting was unanimously adopted. The engagements of the evening concluded with prayer.

REFORMATORY AND REFUGE UNION.

PRESIDENT: The EARL of SHAFTESBURY.
TREASURER: ROBERT SMITH, Esq., 1, Lombard-street, E.C.
HONORARY SECRETARIES:
ROBERT HANBURY, Esq., M.P., 10, Upper Grosvenor-street, W.
STEPHEN CAVE, Esq., M.P., 35, Wilton-place, S.W.
BANKERS:
Messrs. SMITH, PAYNE & Co., 1, Lombard-street, E.C.
Messrs. RANSOM, BOUVERIE & Co., 1, Pall Mall East, S.W.

Contributions are earnestly solicited for the following purposes:—

GENERAL FUND.—For maintaining the general operations, corresponding with the various Institutions throughout the country, procuring the admission of convicted or destitute persons into suitable asylums, publishing Handbooks of information, and generally assisting in the work of Reformatories.

REFUGE FUND.—For making Grants towards the support of existing Institutions, and aiding in the formation of new ones where found necessary; contributing towards the Emigration of those whose good conduct has commended itself to the managers of the Institutions where they have been located; and in other ways assisting the Houseless and the Destitute.

FEMALE MISSION FUND.—For maintaining a Mission to the Fallen Women of the metropolis, and, as may be found practicable, of the country at large; to employ Female Missionaries to labour amongst them; to give donations with cases admitted to the Homes by their instrumentality; and to assist by Grants the Institutions established for the reception of this class.

Further information may be obtained by reference to the Publications of the Union, to be had on application to the Secretary.

A. O. CHARLES, Secretary.

Office of the Union, 118, Pall Mall, S.W.

REFORMATORY FOR JUVENILE MALE CRIMINALS under 16 years of age.—The HOME in the EAST, Old Ford, Bow, near London.

PRESIDENT,
THE EARL OF SHAFTESBURY.
TREASURER,
JOSEPH CRANE, Esq.
BANKERS,
MESSRS. HANKEY & Co.
HONORARY SECRETARIES,
A. J. SCRUTTON, Esq., 81, Old Broad Street;
THOMAS SCRUTTON, Jun., Esq., 3, Corbet Court, Gracechurch Street.
GOVERNOR,
Mr. J. W. GORDELIER, at the Institution.

Fifty youths are maintained at an annual average cost of about £1000.

Contributions are earnestly solicited, and will be gratefully acknowledged.

SAVINGS BANK DEPARTMENT.

SOUTHWARK, METROPOLITAN, and PROVINCIAL FREEHOLD LAND and HOUSE SOCIETY

Trustees,
homas Pillow, Esq., James Pollock, Esq., and W. H. German, Esq.

FIVE PER CENT. ON DEPOSITS — Dividends payable on and after the 1st of January and the 1st of July.

Offices: 4, Wellington Chambers, London Bridge, Southwark.

RICHARD BRETT, *Secretary*.

Prospectuses forwarded on application.

METROPOLITAN FREE HOSPITAL, Devonshire Square, Bishopsgate, City, N.E.

PATRON.
R. H. THE PRINCE CONSORT, K.G., &c.
VICE-PATRON.
THE RIGHT HON. THE LORD MAYOR.

This Institution is continually open to the Sick Poor of every nation, without requiring a letter of recommendation. It is entirely dependent upon voluntary contributions for its support, and is urgently in want of Funds.

BANKERS: Messrs. BARNETT, HOARE, and CO, Lombard Street, E.C.

GEORGE CROXTON, *Secretary*.

ROYAL NORTHERN SEA-BATHING INFIRMARY: established in 1811.—A New Infirmary, long very much needed, is now in course of erection. £2,000 is required to complete it. This Charity is intended to provide a Home for patients, from all parts of the kingdom, requiring sea air. It is supported entirely by voluntary contributions, and these are earnestly solicited.

THOMAS HUTTON CROFT, *Hon. Sec.*

ONE SHILLING PER SHARE.

THE ART UNION of GREAT BRITAIN, under the sanction of Her Majesty's Most Honourable Privy Council.

First Prize, Painting, value £150
Second „ „ „ £100
with 98 other Picture Prizes, from £5 to £75 each.

Prizeholders have the privilege of selecting their own paintings from any Public Exhibition in Great Britain or Ireland.

In addition to the above Picture Prizes there will be about 500 other prizes, consisting of Engravings, Statuettes, Busts, Vases, &c., in Parian, Terra Cotta, and Bronze.

Tickets, price One Shilling, each ticket entitling the holder to one chance in the drawing, may be had from all the principal Printsellers, Music and Booksellers, and from the office of this paper; or they will be forwarded direct by the Secretary on receipt of an envelope (stamped and directed), together with postage-stamps or post-office order for the number of tickets required.

39, Princess-street, Manchester. SAMUEL H. DEAN, Secretary.

PHRENOLOGY APPLIED TO CHILDREN may lead to the avoidance of many of the errors so frequently committed in their education and subsequent destination. During Mr. DONOVAN'S long and extensive practice as a consulting phrenologist, his attention has been particularly directed to this most important branch of cerebral science. Consultations from 9 to 6 daily. Free Lectures on Monday evenings, as usual. 1, Adelaide Street, Trafalgar Square, W.C.

WHAT WILL THIS COST TO PRINT? is a thought often occurring to literary minds, public characters, and persons of benevolent intentions. An immediate answer to the inquiry may be obtained, on application to RICHARD BARRETT, 13, Mark Lane, London. R. B. is enabled to execute every description of PRINTING on very advantageous terms, his office being furnished with a large and choice assortment of Types, Steam Printing Machines, Hydraulic and other Presses, and every modern improvement in the Printing Art. A Specimen Book of Types, and information for authors, sent on application, by

RICHARD BARRETT, 13, MARK LANE, LONDON.

WHY GIVE MORE?—Excellent TEAS, Black, Green, and Mixed, are now on sale, for Family Use, at 2s. 8d. per pound, at NEWSOM and Co.'s Original Tea Warehouse, 50, Borough. Near London Bridge Terminus. Established A.D. 1745.

ALARM GUN.—Capt. NORTON'S ALARM GUN, without vent or touch-hole, fired at the muzzle by friction, for protection against burglars, poachers, &c., is to be had of the London Gunmakers: Field, Blisset, and Beckwith, Holborn; Reily, New Oxford Street; Lang, Cockspur Street; Daw, Old Broad Street; and Wilkinson, Pall Mall.

A NEVER-FAILING RECEIPT for 30 Stamps, to make the HAIR GROW and CURL.

very valuable RECEIPT for 30 Stamps, to make a FIRST-CLASS HAIR-DYE.

LADIES! If you wish your Skin to be Clear, Fair, and Blooming, send me 30 Stamps, and I will forward you the receipt. Its effect is surprising. It removes Tan, Freckles, Pimples, and other unsightly marks. It is perfectly harmless, and may be prepared by any lady at a trifling cost. These Receipts are superior to anything of the kind hitherto discovered.

MISS GEORGIANA COUVES, PIANISTE, (Organist at St. Saviour's Chelsea), late of Queen's College, where she obtained two First Class Certificates for Instrumental Music, Harmony and Composition, under the tuition of Dr. Sterndale Bennett. begs to announce that she will be happy to attend Private Families and Schools in any locality, within twelve miles of London, to give instruction on the Piano, Organ, and Composition. 35, Stanley-street, Ovington-square, Chelsea, S.W.

THE BOOK-HAWKING CIRCULAR. No. V., April, 1860. Pp. 20 (quarterly), price 1d.

The BOOK-HAWKER: his Work and his Day. Second Edition. By Rev. H. G. De Bunsen, M.A.

BOOK-HAWKING, in connection with EDUCATION. By Rev. Nicholas J. Ridley, M.A.

Published for the "Church of England Book-Hawking Union." Price 2d. each, or 7s. 6d. per 100.

AYLOTT & SON, 8, Paternoster-row.

SPECTACLES—MICROSCOPES—TELESCOPES.—FINE STEEL FRAMES, with REAL PEBBLES, 7s. 6d. and 10s. 6d.: ditto, best Glasses, 5s. 6d., 4s. 6d., 3s. 6d.; Solid Gold, 20s.; Silver, 10s. 6d.

BERNARD DAVIS, 430, Euston Road, Regent's Park (close to Trinity Church), Optician to the Ophthalmic Institutions. Country residents can be accurately suited by stating age, &c. Enclose stamps, or P. O. order, payable Upper Baker Street, London.

MICROSCOPES, magnifying from 5,000 to 15,000 times, mahogany cases, 21s., 17s. 6d, 12s. 6d. Ditto, with all necessaries for every purpose, in upright Mahogany Cabinet, magnifying 60,000 times, £4 4s., warranted.

POCKET TELESCOPES, define ten miles, 10s. 6d.; ditto, 20 miles, 21s.

SMALL POCKET TELESCOPES, of immense power, and to show Jupiter's Moons, &c., by night, 60s.

MAGIC LANTERNS and SLIDES complete, 6s. 6d., 9s. 6d., 11s. 6d., 18s. 6d, 21s., 30s., up to 90s. Catalogues free for one stamp.

ALLEN'S PATENT PORTMANTEAUS, AND TRAVELLING BAGS, WITH SQUARE OPENING; Ladies' Dress Trunks, Dressing Bags, with Silver Fittings; Despatch Boxes, Writing and Dressing Cases, and 500 other articles for Home or Continental Travelling, Illustrated in their new Catalogue for 1859. By post for two stamps.

J. W. ALLEN, Manufacturer of Officers' Barrack Furniture, and Military Outfitters (see separate catalogue), 18 and 22, Strand.

INSTITUTION for the EMPLOYMENT of NEEDLEWOMEN, 26, Lambs' Conduit-street, W.C.

PATRONS.

The LORD BISHOP of LONDON.
The LORD BISHOP of OXFORD.

PRESIDENT.

The EARL of SHAFTESBURY.

LADY PATRONESSES.

The Duchess of Beaufort.
The Lady Elizabeth St. Aubyn.
The Lady Emily Stratford.
The Lady Radstock.
The Hon. Lady Mason.
Hon. Mrs. Sydney Herbert.
Lady Troubridge.
Lady Lindesay Bethune.
Lady Havelock.
Lady Hart.
Mrs. Tait.
Mrs. Gurney.
Mrs. Cave.
Mrs. Alers Hankey.
Mrs. Head.
Mrs. Gell.
Mrs. Bayley (Authoress of "Ragged Homes.")
Mrs. S. C. Hall.
Mrs. Bracebridge.

TREASURER.

Stephen Cave, Esq., M.P.

SECRETARY AND LADY SUPERINTENDENT.

Miss Ellen Barlee.

The Institution for the Employment of Needlewomen has been formed to assist workwomen of good character, by obtaining work for them, and securing to them the full average remuneration which they would receive were they able to take the work directly from the establishments for which it is executed, instead of obtaining it through the agency of a sub-contractor.

It is calculated that the lower classes of needlewomen in London exceed 30,000 in number. Of these a large proportion working from 10 to 18 hours per day, do not earn more than from 2s. to 6s. per week. Taking into account the slack season, illness, and inability to procure work, many can scarcely average half that sum. It may reasonably be expected that each worker employed by the Institution will be able to earn from 5s. to 9s. per week, an amount on which they can at least subsist, and which will save them from the terrible privations, and consequent temptations to dishonesty and vice, with which they have now to struggle.

To make an Institution of this kind permanent, and worthy of public support, it ought not to be a merely charitable effort, but must ultimately be supported to, at least a great degree, by those who benefit by it. The women employed, therefore, will be required to pay a small percentage on their earnings, (say a penny in each shilling,) towards the necessary expenses of rent and taxes, fuel, superintendence, etc. A contribution to this amount from 300 women, earning, on an average, 1s. per day, would fully meet all the ordinary charges of the Institution. But some time must elapse before the Society can secure employment for so many, and in the interval, the same machinery being required, its objects can only be attained by the help of those who feel an interest in the class which it desires to benefit.

For this aid the promoters of the Institution would confidently appeal. They believe the Institution eminently calculated to promote industry and good conduct in the women employed, and to permanently improve their religious and moral condition.

They would gratefully acknowledge the kind assistance which they have already received, and which has encouraged them to commence their undertaking by engaging the premises they now occupy at 26, Lambs' Conduit-street. Here Work-rooms have been prepared sufficient for the employment of about sixty workers, with a dormitory for the accommodation of a few of the most friendless and destitute—women with families being allowed to take the work to their homes. Further subscriptions are absolutely necessary to enable them to carry out their objects effectively; and especially to provide a Guarantee Fund, from which the parties who intrust work to the Society may receive security if desired, and may be indemnified for any incidental loss or damage. Such additional assistance the promoters of this Institution would earnestly solicit, as well as supplies of work, to allow of their giving the women constant and regular employment.

A single Institution of the kind now established, can only partially provide for the wants of so numerous a class, but should this effort succeed, and sufficient funds be obtained, it is intended to open Branch Institutions in other parts of London.

The Institution is open to the inspection of Visitors from 10 to 5, each week-day Mondays and Saturdays only excepted.

Post Office Orders addressed to the Secretary may be made payable at the Post Office, 62, High Holborn, W.C.

Donations will be thankfully received by Messrs. Prescott and Co., Bankers, Threadneedle-street.

Further details will be found in a little work, entitled "Our Homeless Poor, and What we can do to Help them." J Nisbet and Co., Berners-street, and of all Booksellers.

"Parcels of cast-off clothing will be thankfully received for the poor women, many of whom are most destitute.

NATIONAL ASSOCIATION for the PROMOTION OF SOCIAL SCIENCE.—The FOURTH ANNUAL MEETING will be held at GLASGOW, on MONDAY, 24th SEPTEMBER next, and five following days.

PRESIDENT.

THE RIGHT HON. LORD BROUGHAM.

VICE-PRESIDENTS.

The Hon. the Lord Provost of Glasgow.
Sir Archibald Alison, Bart., D.C.L., Sheriff of Lanarkshire.
The Very Rev. Principal Barclay, D.D.

PRESIDENTS OF DEPARTMENTS.

I.—The Lord Advocate.
II.—Sir James Kay Shuttleworth, Bart.
III.—The Hon. Arthur Kinnaird, M.P.
IV.—Viscount Ebrington.
V.—Sir James Emerson Tennent.

GENERAL SECRETARY.

George W. Hastings, Esq.

TREASURER.

W. S. Cookson, Esq.

FOREIGN SECRETARY.

H. G. Bohn, Esq.

LOCAL SECRETARIES.

W. G. Blackie, Esq., Ph.D.; Alex. B. M'Grigor, Esq.; J. Wyllie Guild, Esq.

LOCAL TREASURER.

James M'Clelland, jun., Esq.

General Office—3, Waterloo Place, Pall Mall, London, S.W.

Local Office—103, St. Vincent Street, Glasgow.

The Association is established to aid the development of Social Science, and to guide the public mind to the best practical means of promoting the Amendment of the Law, the Advancement of Education, the Prevention and Repression of Crime, the Reformation of Criminals, the adoption of Sanitary Regulations, and the diffusion of sound principles on all questions of Social Economy. The Association aims at bringing together the various Societies and Individuals who are engaged or interested in furthering these objects; and without trenching upon independent exertions, seeks to elicit by discussion the real elements of truth, to clear up doubts, to harmonise discordant opinions, and to afford a common ground for the interchange of trustworthy information on the great social problems of the day.

REGULATIONS CONCERNING MEMBERS AND ASSOCIATES.

Any person may become a Member of the Association on payment of One Guinea annually, or Ten Guineas as a Life Subscription. Every Member receives a ticket, which admits to all the meetings of the Association, and is entitled, without further payment, to a copy of the Transactions.

Any person may become an Associate for a year, on payment of 10s. Every Associate receives a ticket, which admits him to all the meetings of the Association.

A limited number of Ladies' Tickets, transferable, will be issued at 10s. each, which will admit the holder to all the meetings of the Association.

Any Public Body, such as a Chamber of Commerce, a Mechanics' Institute, &c., may become a Corporate Member, on payment of One Guinea annually. Every such Public Body will receive (without further payment) a copy of the transactions, and may nominate two representatives to attend the meetings of the Association.

REGULATIONS CONCERNING PAPERS.

Every Paper must be sent to G. W. Hastings, Esq., General Secretary, 3 Waterloo Place, Pall Mall, London, S.W., on or before the 1st day of September next. On the first page of every paper must be written the Subject, the name of the Author, and his Address. The Council reserve the right of rejecting any Paper they may consider inappropriate.

Not more than twenty minutes can be allowed for the reading of any Paper.

No Paper already published can be read.

A list of the Papers to be read, and the order in which they shall be taken, will be issued at the time of the meeting, and supplied to members at the Reception Room.

Every Paper when read must be left with the Secretary of the Department.

No Paper when read can be published by the Author (unless by permission of the Council), previous to the publication of the Transactions of the Association for 1860.

The Council may print any paper, either in whole or part, or may exclude it from the Transactions, as they see fit.

IMPORTANT to every Man who keeps a Horse, Cow, Sheep, or Pig. The receipt to make the celebrated HORSE and CATTLE FOOD, for 13s. per cwt., the selling price being 42s. and 50s. per cwt.

N.B.—Two receipts sent for 44 Stamps; three for 60 Stamps; or the four for 78 Stamps.

Address, Mr. J. Tait, Chemist, Newcastle-on-Tyne.

BROWN and POLSON'S PATENT CORN FLOUR,

Preferred to the best Arrowroot.

Delicious in Puddings, Custards, Blancmange, Cake, &c., and especially suited to the delicacy of Children and Invalids.

The *Lancet* states—"This is superior to anything of the kind known."

Trade Mark and Recipes on each Packet, 4 and 16 ozs.

Obtain it where inferior articles are not substituted, from family Grocers, Chemists, Confectioners, and Corn Dealers.

PAISLEY, DUBLIN,

77A, Market Street, Manchester, and 23, Ironmonger Lane, London.

BROWN & POLSON'S

PATENT CORN FLOUR.

The *Lancet* states: "This is superior to anything of the kind known."

THE most wholesome part of the best Indian Corn, prepared by a process Patented for the Three Kingdoms and France, and wherever it becomes known obtains great favour for Puddings, Custards, Blancmange; all the uses of the finest arrow root, and especially suited to the delicacy of Children and Invalids.

BROWN & POLSON,

Manufacturers to Her Majesty the Queen: Paisley, Manchester, Dublin, and London.

PENCILS! PENCILS! PENCILS!

GOOD STATIONERY, at reasonable Prices,

At G. BLIGHT'S, 168, Fenchurch Street, London, E.C.

WHAT A NUISANCE!!!

There's the point gone again, just in that fine outline, too;
And the Grit!!! Oh, what *shall* I do?
I *must* try those Gilbert's Pencils that Blight sells.
Let me see, it's G. Blight, General Stationer, 168, Fenchurch Street, London, E.C.

And he sends a set of six different shades, post free, for Eighteen Postage Stamps.

GLENFIELD PATENT STARCH,

Used in the Royal Laundry,

And pronounced by Her Majesty's Laundress to be the finest Starch she ever used.

WHEN YOU ASK FOR

GLENFIELD PATENT STARCH,

SEE THAT YOU GET IT,

As inferior kinds are often substituted.

Sold by all Chandlers, Grocers, &c. &c.

WOTHERSPOON and CO., Glasgow and London.

PHOTOGRAPHY.—This beautiful and wonderful art has long been in the hands of mere charlatans and speculators, whose imperfect knowledge and unskilful manipulations have produced only vile caricatures of our friends. Mr. Barrable, 244, Regent-street, is the first, who, with the reputation of an artist, has applied himself to the study and practice of Photography. In his studio the most beautiful portraits are produced at half the usual prices charged at the West End for much inferior articles. Mr. Barrable respectfully invites the public to an inspection of his specimens.

HOLLOWAY'S OINTMENT AND PILLS.—SKIN DISEASES, SCROFULA, SCURVY.—This class of complaints not only afflicts the individual, but is too frequently transmitted to the offspring, entailing on the innocent victims unmerited misery. How important, under such serious consequences, it becomes thoroughly to eradicate strumous taints from the blood and glands, must be as evident as it is incumbent on all sufferers. Holloway's Ointment and Pills uproot all such latent corruptions. The Ointment, applied over the affected parts, passes to the glands and blood, circulating round about, and completely cleanses both. This soothing Ointment possesses the power of ejecting the seeds of all virulent eruptions and ulcerous distempers from the system. Holloway's Pills should generally be taken while his Ointment is being used.

THE ROYAL HUMANE SOCIETY.

An extraordinary general court of the governors of this institution was held August 1st, at the office of the Society, 3, Trafalgar-square; Mr. B. B. Cabbell in the chair. The minutes of the last meeting having been read and confirmed, it was proposed and carried that in future five governors shall form a quorum at the general courts, instead of seven, as heretofore, and that in the event of a vacancy occurring in any of the offices of treasurer, trustee, chaplain, committee, secretary, collector, or inspector, during the year, from death or otherwise, the committee shall have the power to fill up the vacancy, subject to the approval of the next general court. Mr. Case was elected a trustee, in the place of Mr. Barkly; and Mr. Dimsdale, the banker, was elected a member of the committee. A resolution was proposed, requesting Mr. Hawes to allow himself to be put in nomination for the office of treasurer, in the place of his father, who had been treasurer to the Society for seventy years, and had recently died, but it was postponed for further consideration. Since December last fifty-nine cases have been brought under the cognizance of the Society, in which one or more lives have been placed in imminent peril, and in which sixty-three persons were successfully treated by its officers, but eight were beyond recovery; during the same time eleven had attempted suicide. In Hyde-park the number of cases since December last was sixteen, of whom ten were successfully treated, two being beyond recovery; four were found drowned, and two attempted suicide. Eight cases were referred to the next general court for the award of the Society's silver medal. The following is a list of the names of the persons to whom the Society's medal was awarded yesterday:—To Frederick Cavell, seaman of the ship Areta, for saving a boy belonging to the same vessel, off Cape Leuwin, Australia, in May, 1859; to Mr. W. F. Beaumont, third officer of the ship Haddington, for saving J. J. Wynn, apprentice, at sea, on the 25th of October, 1859; to Peter Secker, able seaman, her Majesty's ship Fury, for saving W. Borthwick, able seaman, off Flamborough Head, on the 28th December, 1859; to Mr. J. Cameron, boatswain, and F. Davis, seaman, her Majesty's ship Queen, for saving Niel Sinclair, able seaman, at Spithead, on the 19th of January, 1860; to Mr. W. Heygate, for saving William Savage, who accidentally fell into a reservoir at Brent, Pelham-hall, Herts, on the 17th of February, 1860; to Mr. E. H. Seymour, mate, her Majesty's ship Imperieuse, for saving Private T. S. Parks, Royal Marines, at Rhio Straits, China, on the 11th of January, 1860; to James Bean, able seaman, her Majesty's ship Hannibal, for saving Henry Arnold, at sea, on the 26th of January, 1860; and to Josiah Morgan, for saving Eliza Strong from the River Usk, Abergavenny, on the 13th of April, 1860. Other business of a formal nature was then transacted, and a vote of thanks to the chairman closed the proceedings.

INDUSTRIAL EMPLOYMENTS IN GIRLS' SCHOOLS.

In the notice of the Ladies' Sanitary Association's course of lectures contained in our last number, we referred cursorily to the one on Industrial Employments in Girls' Schools, which was delivered in that course by the Rev. John Armitstead, Vicar of Sandbach. We now give some further notice of that lecture, believing the subject to be one of especial importance to all interested in the improvement of education.

The lecture contained the results of Mr. Armitstead's own experience in his parish schools, where he has introduced the industrial training which he advocates. It consists of practical instruction in the management of infants and children, and in general household work, laundry work, plain needlework and cooking.

With regard to boys' schools, Mr. Armitstead said:—

"In them I believe there is generally little opportunity for industrial training. . . . . There may be exceptional cases, as, for example, when a school is established in the neighbourhood of some mansion with extensive grounds, to which the boys may be admitted to work under the careful supervision of trustworthy persons. In workhouse boys' schools, also, industrial training may be beneficially introduced. But I humbly hope one day to see workhouse schools abolished. . . . . It would be a happy day if we could see our workhouses used only for the reception of adults, and all children withdrawn. I do not say this would be practicable to the fullest extent in very large towns; though it would be partially so even there. But in most workhouses a very simple plan might be adopted, which would withdraw all the children, and secure for them an education infinitely better and more likely to make them valuable to society than any they can obtain within the workhouse walls. The plan I recommend is one which I have already carried out in my own immediate neighbourhood. It is this:—At the Board of Guardians let a resolution be carried, authorising the clergyman to take out of the workhouse any children for whom he will undertake to provide a suitable education, receiving such payment as would cover the expenses of their maintenance in the workhouse. In order to do this effectually, and for the benefit of the children, it is necessary to find foster parents, some respectable conscientious persons, who will take good care of them. With us the success of this plan was doubted at first; it works, however, admirably. The children find homes and maternal influences, instead of being herded together in the workhouse. Among neglected children who corrupt them, they are placed where a good example is set before them. They learn to entertain feelings of self-reliance and self-respect, and, afterwards, when they go into service, in illness, or on any other occasion, they have a home to come to, and some one to take a kindly interest in them. I repeat that this plan has hitherto worked exceedingly well. with us, I may be permitted to mention an illustrative case, which has just occurred. One of my parishioners came to me and said, 'Perhaps you are not aware that I have a little money in the Savings Bank. I do not think my health is very good, and I am very much attached to the boy you sent me, and I should feel greatly obliged if you would get something in the shape of a will drawn up, so that if anything happens to me he may receive 5*l*., and afterwards 10*l*. more when he is apprenticed.' I mention this case to show that it is only natural to look for manifestations of kindly feeling on the part of the foster parents who may have no children of their own upon whom to fix their affections. I think that by some such plan as this the horrible influence of pauperism would be diminished. In proof of the existence of this influence, to a fearful extent in this country, I may state that in a township in the neighbourhood of Warrington it was found upon investigation of the parish books, that one family in lineal descent, children, fathers, and grandfathers, had received in parochial relief no less a sum than 1,400*l*. I think facts such as this prove that in educating children in workhouses we are perpetuating pauperism.

"I now proceed to that which is more immediately the subject of this lecture, the Application of Industrial Employment to Girls' Schools. . . . . Having stated my opinion that industrial training is not generally applicable in boys' school. I further state that in girls' schools I believe it to be absolutely essential."

Mr. Armitstead suggested that the instruction in the management of infants and children which he advocates should be given by arranging every day for one of the pupil-teachers and a few of the elder pupils from the girls' schools to attend in rotation the infant schools, and there to study the habits and laws of life of the little inmates. Upon this point he said:—

"Most of the girls became nursemaids in tradesmen's houses, or assist in other ways in such establishments. To such girls it is of great use to be acquainted with the habits of children, the little ailments to which they are subject, and the best means generally of tending and teaching them. I put it to this meeting whether such knowledge can be more effectually imparted than by the plan I suggest.

"In the girls' schools, in relation to

Digitized by Google

this matter, it might be very desirable to have some simple course of instruction in the treatment of ailments, such as croup, with which infants are suddenly seized, and in which it is often necessary that remedies should be applied before there is time for the attendance of a medical man."

With regard to instruction in household work, Mr. Armitstead said :—

"In the schools themselves there is little opportunity for acquiring a knowledge of household work, beyond sweeping them, keeping them tidy, and attending to a few other very simple matters. But it is very easy to let the children go in rotation to the master's or mistress's house, to assist there in the domestic work. Especially may this be the case when the pupil-teachers reside in the master's house. By pursuing this system in rotation all the children become, to a certain extent, instructed in this kind of work. Though they may not thus learn it thoroughly, they will acquire a sort of handiness which will be of great advantage.

. . . . . .

"Laundry work is the next part of the instruction which I advocate. We have a very small wash-house with us, but it answers the purpose. In the beginning of each week the children bring to be washed the clothes necessary for them in the following week. All that we do is to instruct in the proper method of washing, and to provide tubs and hot water, the children washing the clothes and finding the soap. When they are completed, they are taken home to their mothers, who receive them very gladly, being saved much trouble, and seeing the proficiency which their children are attaining in that which must eventually be very useful to them. We find this plan works admirably.

"The next subject to which we devote the children's attention is making their own clothes. The children generally make their own clothes in the school. Those who are acquainted with schools of this kind well know that it is often a matter of difficulty to determine the proportions of time which the children should devote to working for themselves and to working for the profit of the school. The profits of the children's work are very small in any case, and I consider that if the parents require such a quantity of clothes to be made as will occupy the children during the whole of the time allotted to needlework, it is far better to allow them to work for their parents only. We have a store of material for clothing, bought wholesale, at a very cheap rate. It may not be irrelevant to state the way in which we buy it. In the manufacturing districts it is customary to export clothing material in pieces of a given length. After measuring out these pieces to the required length, remnants of some yards are torn off. These are technically called 'fents,' and are sold in quantities at something less than half the usual wholesale price of such materials. By purchasing these remnants, we get a variety of the best prints, of all patterns, at a very cheap rate. The child who wants a frock chooses her own pattern, the mistress or pupil-teacher cuts out the frock, and the child makes it up. If the mother is able to pay for it at once, she does so, if not, it is paid for by a penny or two pence per week. The child takes much more care of the dress, through having had some part in making it, and it costs the parents very little. . . . . .

"I come now to that part of my subject which has been the main inducement with me for delivering this lecture. I refer to the establishment of school-kitchens, wherein practical instruction can be given in cooking. There have been great difficulties heretofore with regard to this. With us the great difficulty was want of funds. This we have met partly by the application of the alms collected after the Sacrament. This money is commonly left at the disposal of the clergyman and the churchwardens, in equal moieties. With us the churchwardens readily, upon application, gave up their share of the money, and we threw it at once into one common fund for the establishment and maintenance of a school kitchen. This fund was further aided by an alms box, and by special subscriptions, and once by a collection after a sermon. Thus came the funds for our kitchen. . . . . Many who have visited it came expecting to find a large building and a great deal of cooking apparatus, and they were at first greatly disappointed to see only a very small building, merely a sort of shoring attached to the house. This does very well for us, and what we have done may surely be done elsewhere. We might have cooked by a coal fire; but, upon consideration, it was thought it would be much cheaper to do so by means of a small gas-stove, which was purchased of Messrs. Deane, Dray and Co., of London Bridge, for 9*l*. With this stove, which is only 3ft. 6in. high, and 2ft. 6in. square at the top, we can cook for thirty people.

. . . . . .

"In this kitchen the children receive practical instruction in cooking meat and vegetables, and in making puddings, broth, and gruel, which are given to our sick poor. . . . . Even a child does not like to work to no purpose, and we find it has a most animating and healthy influence on our school-children's minds to know that they are working for a beneficial, praiseworthy object—working to relieve the necessities of their fellow-creatures at a time when help is most needed. . . . . .

"By means of this little kitchen we not only instruct the children in a most important branch of domestic economy, but in a parish containing a population of four thousand we supply food to every sick person who is in need of it. The district visitors, the medical man, and the respectable parishioners generally, whether subscribers to the kitchen or not, are at liberty to come there and insert an order in the order-book, 'Let A. B. have roast mutton three days a-week, and puddings the other days, or gruels, or whatever may be required to facilitate recovery, as the case may be.' We have many dissenters in our parish; but in this distribution of food no sectarian distinction is made; we give to all who want, irrespective of creed. In some instances, individuals in sickness have been supplied with food for upwards of a year, until their recovery, or such time as it has pleased God to withdraw them from us. The daily average of recipients of food has been from twenty to thirty-five, which is, I believe, about the average number of needy sick people in parishes of this size.

"To show our plan of working this kitchen, I will now state what account-books we have used from its establishment, some three or four years ago, till now. The first book is called the *Order-book*. In this are entered the names of the persons who require food, and of those who request that it should be supplied to them. The second is the *Delivery-book*. In this those persons who receive the food sign their names, or their mark, as evidence that they have received it. The third is the *Waste-book*. In this everything that is bought, and everything that goes out of the kitchen, is entered. The fourth is that very important book the *Cash-book*, in which are entered the funds contributed, the sources whence they come, and the purposes to which they are applied. These books are kept by the children themselves, so that at the very time when they are supposed to be employed exclusively in cooking, they are learning something of the very important art of book-keeping, and becoming impressed with the necessity of keeping an account of expenses. If these children eventually go out as cooks, or rise, as they may do, to the position of housekeepers, this knowledge of book-keeping must prove most valuable to them.

"At first we confined the distribution of food to those sick persons who were not in receipt of parochial relief: but as we went on a different plan suggested itself. In connection with many Unions, indeed, I believe, with almost all, the relieving officer is in the habit of ordering extra-occasional relief to the out-door poor. There are many poor persons receiving a weekly allowance who in case of sickness require additional relief, which is given to them by the parish, say eighteenpence or two shillings per week, to be expended in meat or other suitable food. Now, in such cases the poor person on going to the butcher's shop is not considered a good customer, and is often not very well served. Even if a good, useful piece of meat be obtained, it is in all probability very imperfectly cooked, and if the sick person gets two meals from it, that is the most. The probability is, however, that it will be all cooked and eaten at once, if not by the sick person, by the hungry family around, from whom it is difficult to keep it. Well, it occurred to us that this extra-parochial relief money might be paid to us, and that we might then supply the sick persons with food from our school kitchen. This plan has been adopted, and now when the relieving officer orders extra relief he sends the orders to us for so many dinners. Our charge is three pence per dinner, and thus eighteen pence provides a sick person with six good dinners, and he gets the full benefit of the meat himself. This plan has worked exceedingly well, to the great satisfaction of the ratepayers and the poor people. You will easily understand that in the case of clergymen and parochial visitors it must be a very great advantage to be able thus to

Digitized by Google

provide suitable food for the sick poor whom they visit. In most cases where food is given to the poor, it is given through the medium of servants, who are not always careful as to its quality and suitability to the case. From our kitchen, however, the food is given hot and well cooked, and under the direction of the medical officers in attendance on the sick persons. We supply their wants without regard to expense, being governed only by the consideration of the special requirements of each. I cannot describe to you the comfort and satisfaction this plan affords to me as well as to all connected with it. I am thankful to say that the knowledge of what is going on among us has led to similar operations in various parts of the kingdom. A kitchen has been established at Worcester, on a very large scale, I believe, and I have reports of similar institutions in Clifton, Bristol, Wakefield, one or two districts of London, and other places. . . . .

"The way for a school to win its way to the hearts of the people is, by conveying instruction suited to the children's needs. It is of great benefit not merely to instruct them in subjects which their parents may only value highly from being ignorant of them—such as geography, history, grammar, and so on—but to instruct them in matters which the parents must appreciate, from their own practical experience of their utility. The parents will thus learn to value the school. . . . .

"In our parish the result is, that, though, as I have told you, there are many dissenters, we have no dissent with regard to our National Schools. Several other schools for the poor previously existed; but one by one they have fallen off. People are satisfied with our school, and there is now no other in the whole parish.

"I have said so much about industrial training that I may have given a false impression as to my ideas on the subject of general education. I will say, then, that I do not wish to see one whit less of intellectual development among our school-children than at present exists. I am thankful to say, too, that I can refer to the reports of her Majesty's Inspector as proof that since we have introduced industrial training into our schools, they, instead of retrograding intellectually, have progressed. This is not to be wondered at. The bow that is kept always strung loses its elasticity; so the child that is always poring over books will not make more progress in the long run than the one who at times finds relief from his intellectual labour in industrial employments, especially if they are such as promote his physical development. When such employments are kept within proper bounds, they are found in no way to interfere with the mental progress of the children. . . . . .

"My task is now nearly done. Let me now express my earnest hope that you who have kindly come here to-day to listen to this imperfect relation of facts will communicate them to others, so that the knowledge of them may be widely diffused. I believe that if plans similar to ours were adopted in all schools throughout the length and breadth of the land, incalculable benefit would be conferred on thousands of poor families. Nay, I think it would be beyond our power to arrive at anything like a true estimate of the great benefit which would be conferred on the public at large. It is with the earnest hope that a knowledge of our plans may be widely diffused, and with the firm conviction that they are perfectly practicable in other places, that I have been induced to lay them before you. Those who know the habits of the poor—those who know how often the poor are unable to take advantage of a turn in a complaint, by administering wholesome suitable food at the right time, and how often they have recourse to something altogether unsuitable for them, being utterly unable to obtain what is good and nourishing, and how frequently fatal results follow; those will feel how great a blessing it would be for some kind friend to step into the sick man's home, and say, 'Give yourself no trouble, you shall have from me good and suitable food, until, by God's blessing, you are restored to health.' With us, the poor man's child takes home this message, and our school sends it. I only wish this subject were taken up generally by the clergy of this land."

Our space does not permit us to borrow further from this valuable lecture, but those of our readers who wish to peruse the whole of it, will, we are glad to learn, have an opportunity of doing so in a volume of lectures which will be shortly issued by the Ladies' Sanitary Association.

Metropolitan Improvements.—No less than three select committees of the House of Commons, appointed to inquire and report upon matters of great local interest to the metropolis, have just brought their labours to a close. We allude to the Thames Embankment Committee of Sir Joseph Paxton, the South Kensington Museum Committee of Mr. Lowe, and the British Museum Committee of Mr. Gregory. The first of these, the Thames Embankment Committee, have presented their report, which was ordered to be printed by the House of Commons on Friday night, but which is not yet in the hands of members in its complete shape. We are enabled, however, to present a detail of the recommendations which the committee have agreed to submit to the House, after a careful consideration of the evidence submitted to them. From the scope of these recommendations, and especially from the way in which the great difficulty of all—the raising of the money—is proposed to be dealt with, there is some reason to hope that, after all, something will be done towards effecting that most desirable object, the best means of providing for the increasing traffic of the metropolis, by the embankment of the Thames. The committee have carefully considered the several plans which have been brought before them with a view to the embankment of the Thames, and they have received much valuable evidence on the subject. In connection with the matters referred to them they have considered it necessary to inquire into the mode proposed for constructing the low level sewer about to be made by the Metropolitan Board of Works, and they found that if that sewer were carried unde the Strand and Fleet-street it would cause a vast amount of injury to the trade and traffic of the district, which it is scarcely possible to estimate. The importance of providing for the construction of the low level sewer in connection with the embankment has been recognised by the various engineers whose plans have been submitted to them; and provision is made in all these plans for constructing the low level sewer along the foreshore of the river and within the embankment. The committee have had many plans before them, out of which they have agreed to select the three presented by Messrs. Bazalgette, Bidder, and Fowler, civil engineers. All of these comprise the plan of including in the embankment the low level sewer on the north side of the Thames, the embankment to extend from Westminster to Queenhithe—that is, from Westminster Bridge to London Bridge. All the plans comprise a railway and a roadway—in two of them on the same level, and in the third on different levels. The wharfs are not to be interfered with, but, on the contrary, to be improved by the construction of docks and other facilities within the embankment. The committee has rejected the proposition to attempt to make it a public company, and recommend that as the Legislature have already intrusted the main drainage of the metropolis to the Metropolitan Board of Works, by the 21st and 22nd Victoria, cap. 104, sec. 11, and armed them with powers to deal with the foreshore of the river in connection therewith, the construction of the embankment should also be intrusted to them. They recommend that, in aid of the funds already voted for the sewer, the coal and wine duties, which are to expire in 1861, should be renewed for a limited time, and the proceeds be applied to the expenses of the embankment. The whole expenses of the embankment, including sewers, &c., are estimated at 1,000,000*l*. One-fourth of this at least would be the cost of the length of sewer to be made. Indeed, it would be much more if it ran under Fleet-street and the Strand. The rest is to be raised by the renewal of the 8d. and the 1d. coal-tax, and the wine-duty of ½d., from which an annual sum of 100,000*l*. may be expected, and the committee recommend that the cost of the embankment should be a first charge upon these duties. The engineering and architectural interests were amply represented on the committee by Sir J. Paxton, Sir M. Peto, Messrs. Locke, Tite, and Cubitt. The latter and Mr. Roupel represented the metropolitan interests, Mr. Cowper and Lord John Manners were present for the official class, and the country interest was represented by Sir J. Pakington, Mr. Beamish, Lord R. Montague, and others. From the simplicity of the propositions, and the manifest, indeed, the pressing, necessity of the scheme, we are glad to see a prospect of its being carried out at length. The money can be easily raised in the manner and in the proportions proposed. The committee have declined to apply for the application of the hackney-coach duties to this purpose, and have indicated a mode by which we think the funds may be raised without entrenching on the general taxation of the country. They recommend, however, that a public guarantee should be given to secure the

Digitized by Google

raising of the necessary funds. They omit to take into account the rents of surplus lands or the profits upon the railway traffic. The plan seems so moderate and easy of accomplishment that we hope it may be allowed to be set going, even at this late period of the session. It is much more important than the elaborate Bill of Mr. Tite, giving increased powers to the Metropolitan Board, and which may now be safely put on the shelf, and introduced in a more modest shape next session. Mr. Lowe's committee on the South Kensington Museum will, we understand, propose an additional grant for public buildings there of 27,000*l.* a-year, to be applied to the construction of a building of a more beautiful and permanent nature, and erected so as to be part of any future plan for a uniform collection. It is proposed to remove from the British Museum only the mediæval part of the collection, and such duplicates and superfluities as cannot find room in Bloomsbury. Mr. Gregory's committee on the British Museum will propose several reforms and additions, and will also put in a claim for an additional grant of money.—*Observer.*

Statistics of Life.—Besides his quarterly report published about a month after the close of every quarter, the Registrar-General of England issues a more elaborate annual report, which takes much time to prepare; the report for 1858 has just appeared. Nearly a million and a-half of names were inscribed on the national register in that year; it is a book into which we all get, for, even if we do not marry, we can neither enter life nor quit it without occupying our "line and a half" in this history, at all events. Referring first, not to England alone, but to Great Britain, we find that its estimated population in the middle of 1858 was 22,626,334, and the excess of births over deaths in the year 246,488. 759,676 children were born alive, 351,346 persons were married, and 513,188 died; so that, on an average, upon every day in the year 2,080 children were born, 962 persons married, and 1,405 died, leaving a gain of 675 as the result of the day. The birth rate for Great Britain was 33·57 to 1,000 living, the death rate 22·68, the marriage rate (persons married) 15·52. For easy recollection it may be noted that rather more than twice as many are born in a year as are married, and the deaths should not be so high as midway between those two numbers. To 1,000 people living in the two countries the births in the year were 34 in Great Britain, 27 in France—a very striking difference; the deaths, 23 in Great Britain, 24 in France; the persons married 15·5 in Great Britain, 16·9 in France. In Scotland the marriages, if all registered, were not so numerous as in England; the births were almost exactly at the same rate; but the percentage of deaths in Scotland was only 2·047, in England 2·303. Turning now to England and Wales only, we learn that to every 1,000 girls 1,045 boys were born, and 102 males died to every 100 females, the average of 21 years being 103; but there are more females living in England than males, and out of equal numbers living 105 males died to every 100 females, the average being 107. The births are always most numerous in the first half of the year; in 1858 they were as 2,091 to 1,909 in the two half-years. To every 100 women living of the age of 15-45 there were 14·3 births in the year. 43,305 children were born out of wedlock in 1858, or one in every 15 of all the children born alive; 106·2 boys were born illegitimate to every 100 illegitimate girls, while among children born in wedlock the boys were only 104·4 to 100 girls. The marriages in 1858 were below the average. Marriages are celebrated in England and Wales in 12,350 churches, and in 4,072 chapels not belonging to the Establishment, 505 of these being Roman Catholic. There were 128,082 marriages celebrated in churches, and 27,988 otherwise, 6,643 being of Roman Catholics, and 9,952 in the Registrar's-office, and not at any place of religious worship. The marriages of minors increase. The proportion of minors in 10,000 persons marrying increased from 885 in 1843 to 1,212 in 1858. To every 130 marriages in 1858 by licence there were 728 by banns, which may be taken as the proportion of marriages of the higher and middle classes to those of the lower. In 1841, 41 in 100 of the persons married had to sign the register with their mark; in 1858 only 32; the improvement is most striking among the women. In 1858, 73 in 100 men, and 62 in 100 women, wrote their names on this important occasion. The mortality of the year was high. The deaths in the chief towns were at the rate of 2·655; in the country districts, 2·006. The deaths in the army abroad were more than usual, in consequence of the Indian mutiny. The average strength of the army abroad was 111,730, and the deaths abroad were no less than 7,363, more than double the number in the previous year, when the strength was 77,676. The number of merchant seamen at sea in 1858 is calculated at 177,832, and 3,486 deaths at sea among this body were reported to the Registrar-general of Merchant Seamen, with an account of their effects. This would be 19·6 in 1,000; a high rate among men of their age and physical advantages. This return does not include seamen dying ashore in foreign parts; the account of their effects is sent to the Board of Trade by the consuls. The captains of vessels return the births of 112 English subjects in British vessels at sea, and 390 deaths. We close with a table, which must be read with the recollection that on our side the population of Scotland and Ireland, between nine and ten millions, are not included.

Prisons and Prisoners.—The annual reports of the Directors of Convict Prisons in England have been issued—documents necessarily of much interest now that the Penal Servitude Act retains in this country large bodies of convicts who were formerly sent abroad. Of course these reports do not touch the county and borough prisons, in which there were at the latest return (Michaelmas last) 15,574 prisoners. During the twelvemonth 126,861 persons had been committed to those gaols, but many of them for short periods and slight offences, there being not a few who were afterwards acquitted, and 15,120 who were but debtors; and it is satisfactory to have to add that the average number of prisoners showed a decrease, the recommittals of the same prisoners were fewer, the proportion of juvenile offenders decreased, and the punishments for prison offences diminished in a greater degree than the prison population. It is of the worst, most depraved, and most dangerous of this class that the Convict Prisons Reports treat—those who are sentenced to penal servitude, and removed from these local gaols to Government prisons to undergo their sentence, first in separated confinement and then in associated labour. There were 11,007 prisoners in the convict prisons of England at one time or other in the year 1859; the number at the beginning of the year was 8,115, and at its close 8,122, and of this last number 1,188 were women. In the course of the year 224 of the men were transported to Western Australia, 421 were sent to labour at the public works of Gibraltar and Bermuda, and 215 men and 20 women were released under orders of licence, or, as they used to be called, tickets of leave. No less than 1,837 were set at liberty in consequence of the expiration of their sentence. While in separate confinement the convicts are employed in work, and instruction is given to them—many learn there for the first time to read; they meet at school, at chapel, and in exercise, but are punished if they communicate with one another, the punishment being generally a dark cell and punishment diet. At Millbank the women made last year 43,728 shirts, for a city firm, without a single rejection. In the next stage, the men are employed on public works at Portland, Portsmouth, or Chatham, where they work ten hours a-day when there is light enough; but are allowed half a day's schooling in the week. Endeavours are made to educate them sufficiently to qualify them for useful situations, and the effort is appreciated; they are divided into classes, according to character and conduct, and in the last few months of their time men of exemplary prison character are placed in posts of some confidence, without any immediate supervision over them. Some small gratuities may be earned by diligence, to accumulate against the day of discharge, being then paid with precautions. Those who are only fit for light labour are sent to Dartmoor Prison, which is in a highly oxigenised and bracing spot, and convicts unfit for labour have been hitherto sent to Lewes Invalid Prison, now merging in the new prison at Woking. A considerable number of these last improve in health sufficiently to be draughted to Dartmoor. In speaking of the diet allowed them, the surgeon notes that the men most difficult to please are from the vagrant class, or from the lowest grades of society. From all these convict prisons the reports are satisfactory. The convicts behave in an orderly manner, and work well. The maintenance of such good order is, in a great measure, attributed to the system of remitting a considerable part of the sentence to well-conducted industrious men, who appear likely to endeavour to earn an honest livelihood on their discharge. As for the question

Digitized by Google

whether there is any real reformation wrought, it seems to be considered that of the regular habitual thieves there is little hope —their reformation, as Mr. S. Redgrave says, is as difficult a task to themselves as to their teachers. The experienced chaplain of Millbank Prison classifies the convicts received there in 1859 thus:—61 per cent. (869) were professional thieves, following crime as a business; 25 per cent. (304) were careless profligates, but not hardened men; 6 per cent. (89) were occasional offenders, on the whole working honestly for their living, but committing a dishonest act when a favourable opportunity occurs; the remaining 8 per cent. (108) were comparatively respectable, but had resorted to a crime to extricate themselves from difficulties, generally caused by their not having had sufficient self-denial to live within their means. Of all but the regular thieves he has hope that with few exceptions they leave the prison better men than when they came, and with sufficient right principle to prevent their relapsing into crime. Of the lads at Parkhurst the governor reports that in no one of the sixteen years during which he has had charge of that prison was the conduct of the inmates so satisfactory; it has been marked by order, obedience, and cheerful industry. The directors of convict prisons consider that this section of the juvenile population is gradually yielding under the influence of Ragged School teaching, district visiting, and the juvenile Reformatory movement of the last few years. Of the female convicts (at Brixton and Fulham) the report is that "they are generally in extremes." The most troublesome are young women who know that their ill-health will shield them from punishment. But no extent of punishment could ever keep some of them in order. Their perverse depravity makes their cases appear, humanly speaking, hopeless. These cases, however, are few. Among many at Brixton, and more generally at Fulham (to which the best-conducted are sent for final training), there is a strong desire to lead an honest life. Efforts are made to inspire them with self-respect, enable them to break off strongly-rooted evil habits, and take a lively interest in their work, with a desire to turn it to a good account hereafter. Two-thirds of the women discharged from Fulham refuge in 1859 got into situations where they were likly to do well, and were at the end of the year going on satisfactorily. Both to men and women the Discharged Prisoners' Aid Society is rendering most important service at a most critical season. But any attempt to trace prisoners for any length of time in after life interferes with their object of hiding their disgrace and merging in society. A suggestion made by the chaplain of Parkhurst raises a grave question; he considers that, as there is a system of liberating before the time, there should also be a discretionary power to detain after the time. It can do no good to release such men as one of whom we are here told, who said plainly, "It's not likely I'll work for 15s. a-week when I can get pounds." But, at all events, with very many much improvement is now effected by prison discipline and teaching. The prisoners are treated fairly, with consideration and humanity, often with great judgment; they have no just ground of complaint, they are accustomed to regular habits and self-restraint, and have held out to them every encouragement to good conduct and industry. Such seed will surely bring some harvest.

Criminal Lunatics. — Criminals removed from the bar by the finding of the jury that they are of unsound mind have hitherto been ordered into confinement during her Majesty's pleasure; and very capricious, unequal, and often cruel, was the subsequent disposal of the prisoner, whom a legal fiction presumed to be detained by the pleasure of the Sovereign. Punishments so protracted were thus inflicted that advocates have been advised to withdraw the well-grounded plea of unsoundness of mind from the record in defence, because the penalty of this misfortune would be far more severe than that for the offence charged. Again, ruffianly scoundrels, labouring under a temporary aberration at the time of trial, but subsequently recovering when under treatment at Bethlehem, have remained there sane among the insane, violent criminals among the helplessly afflicted, requiring personal restraint and the severity of prison rules in an institution which is devoted to the treatment and consolation of those mentally diseased. These anomalies, to which we directed attention on a previous occasion, have now ceased to exist. An Act has just been passed to amend the Act regulating the Queen's Prison. Prisoners sent to Bethlehem Hospital under the former Act may now be removed, and be dealt with as if they were persons of sound mind, when it is certified that their reason is restored. All lunatics removed from Bethlehem Hospital to other places are to be under the provisions of the Lunacy Act.—*Lancet.*

Isle of Wight Lifeboats.—The Royal National Lifeboat Institution has forwarded two of its best single-banked lifeboats, accompanied with their transporting carriages, to the Isle of Wight. They are to be stationed respectively at Brook and Grange, on the south-west coast of the island. Each boat is thirty feet long, seven feet wide, and rows eight oars. A harbour trial of them took place recently at Limehouse, in the presence of their builders, Messrs. Forrest, the inspector of lifeboats to the institution, and many other gentlemen. Their self-righting qualities were fully and satisfactorily developed. The water thus shipped was self-ejected through patent valves in about 20 seconds. The following are among the most remarkable qualities of this class of lifeboat:—1. Great lateral stability. 2. Speed against a heavy sea. 3. Facility for launching and for taking the shore. 4. Immediate self-discharge of any water breaking on board. 5. The important advantage of self-righting if upset. 6. Strength. 7. Stowage room for a number of passengers. The transporting carriages of the boats, which have been built by Mr. Robinson, of Camden-town, London, are admirably adapted for their purpose. By an ingenious contrivance the boat is launched off the carriage, with her crew on board with their oars in their hands, and they are thus enabled to obtain headway on the boat before the breakers have time to beat her broadside on to the beach. The hauling up of the boat on to her carriage is accomplished with equal facility. The cost of the Grange lifeboat and carriage is the gift of the Royal Victoria Yacht Club, now holding their annual regatta off Ryde. Commodious and substantial houses have been built for the reception of the boats and their stores. The carriages are from designs specially prepared by Mr. C. N. Cooke, architect to the institution. There will probably not be a more complete life-boat establishment on the English coasts than will now be found on the south coast of the Isle of Wight. A free conveyance was readily given by the South-Western Railway Company on their line to the boats and carriages. Arrangements will forthwith be made by the local committees for the organization of the crews and for the appointment of efficient coxswains for the boats. The Rev. Edward M'All, the Rev. J. P. Gage, Mr. George Wyatt, and other gentlemen in the island, have been indefatigable in their exertions to obtain public support in aid of the cost of these establishments, which cannot altogether be much less than 1,000*l*. Indeed, the success of the undertaking is mainly to be attributed to and will always remain a monument of the zeal of these gentlemen. Sir J. Copley, Mr. C. Seeley, and Mr. T. Turner, have been most liberal contributors to this humane undertaking. There are adjacent parts of the coast which as urgently require to be furnished with these means of saving human life as did Brook and Grange. Almost within sight Selsea Bill stands out with its reefs of rocks for miles in advance into the English Channel. Scarcely a gale sweeps along our coasts but some ill-fated vessel drives on to those rocks or the adjoining shore in Bracklesham Bay. This latter spot has during the past two years been the scene of many sad disasters, and numerous lives have been lost for want of a boat that could be put off through the surf, none of the boats, coast-guard or others, being of use with the wind on the shore. The recent wreck of the French bark Diane in the bay resulted in the death of the master and three of his crew for want of some means of reaching the shore. The coast from the mouth of Chichester harbour to the "Park," to the eastward of Selsea Bill, is but thinly populated, and the greater part of the people look upon a wrecked vessel as a godsend. In the Diane's case, on the morning succeeding the wreck, twenty-four large cases, containing the most valuable portion of her cargo, lay upon the beach, emptied of their contents. With a good lifeboat available, these men would find more congenial occupation in the excitement of saving their fellow-creatures' lives than in plundering the cargo of the wrecked ship. The National Lifeboat Institution has now 103 life-boats in connection with it, a truly noble fleet, outnumbered by those of commerce and war, but the largest life-saving fleet the world has yet seen. Some of these boats have even during the present year been instrumental in saving 115 of our fellow-creatures from a watery grave.

SOCIAL SCIENCE—No. III.

(*Continued.*)

We come now to consider the educational condition of the great mass of the population, those who live by manual labour. In the space at our disposal it is impossible to do more than survey the mere outlines of this great division of our subject. Lower class education, as it is sometimes called, cannot be dealt with effectually while viewed as a whole. The conditions of those included in the term are widely different. Their requirements are various, and our present school system, however defective, is an acknowledgment that the educational provision made for them should be such as to be capable of adaptation to their wants. In establishing and carrying out a system of education there are two parties to be considered. The interest and duty of the parent and the interest and duty of the State must be kept in view. It is the interest and also the duty of the parent to fit his child for that condition of life in which he is likely to be placed. Take the child of the agricultural labourer, earning, say, ten shillings a week, and enduring, for that comparatively small wage, a great degree of exposure and hardship. It is necessary that anyone who has to lead such a life of toil in all weathers and seasons should be early habituated to the work. Moreover, the small income of the parent renders it a matter of importance that the weekly means should be as soon as possible increased, even by the slender wage which a young child can earn; and hence that early removal from school which baffles the theoretical educationist, and will continue to baffle him as long as the present conditions of agricultural labour continue. The town mechanic, on the other hand, can afford to give his child a longer schooling; he has higher wages, his work does not require a frame early hardened to weather, and some intellectual acquirement is valuable to him even at the outset. Both these classes of the community, and they are very numerous, are on the whole well provided with the means of education in the National and other schools. The irregularity of attendance, and the early removal, not any want of the machinery of instruction, are the obstacles in the way of education; the former will probably diminish as the advantages of mental training become more generally recognised by the labouring classes; and the latter must be accepted as a fact, not without its advantages both to parent and child, and as a stimulus to the teacher to make the most of the short time available. It is certain that the moral intelligence may be awakened, the mental faculties disciplined to a considerable degree, the ordinary accomplishments of reading, writing, and ciphering be taught, and consequently the foundations of all future intellectual culture be effectually laid by the time the child has reached ten years of age. Now we may fairly hope that this amount of schooling at any rate may ultimately be secured by its parents to every child in England, and were it so we should cease to incur the reproach of being, as respects any part of our population, an uneducated people.

What, then, has the State done to fulfil the duties on its part? Of late years a great deal, and yet only a portion of what it ought to do; or, to speak more correctly, it has done much that it need not have done, perhaps (looking to the policy of encouraging self-reliance) that it ought not to have done, and it has left undone much that it ought to have performed. It has provided a system of inspection, an abundance of well-trained teachers; it has largely helped the erection of school-houses and the supply of proper books, and has contributed lavishly to the support of schools. Whether the help so freely afforded has not in many cases proved a crutch which has prevented the objects of its bounty from walking by themselves, is a question not now to be discussed; but there seem to be two grave faults in the Privy Council system which should have, at least, a passing notice.

The whole plan appears to be based on a purely intellectual idea, the design being too Procrustean in its nature and the means employed too mechanical. The object which the Privy Council apparently has in view is to impart to all the children in England who come within range of its authority a certain amount of head-learning, of a pretty uniform character, and filtered through an unvarying medium. Neither moral nor industrial instruction seem to be taken into account; both, at any rate, are treated as of very secondary importance, and the test applied to masters and scholars alike is the acquisition of a certain amount of book-knowledge. This is very well in its way, but certainly is not all that should be effected by a national education. Yet it is the curse of all Government systems that nothing more than mechanical results can be expected. It is not implied in these remarks that moral and industrial training are necessarily neglected in all the schools which derive aid from the Government grant—the fact is quite the contrary; but it is certain that such training is independent of State aid, has not been encouraged by it, and would continue equally without Privy Council bounty or inspection. The spirit of the system is sufficiently shown by the supercilious and unreasoning contempt with which it treats the schools which do not affect its standard of intellectual acquirement, though they may be far more potent in their effect on the mind and heart than are the lessons of the most highly-trained master.

This original, perhaps inevitable, defect in the Privy Council system has led to the adoption of a rule, logically correct from the premises assumed, that it is the duty of the State to help those most who least require assistance, and to deny aid altogether to the class who are perishing for lack of knowledge. While money is lavished by hundreds of thousands out of the taxes of the country to teach superficial accomplishments, or to pay for the education of many whose parents could well provide for it out of their own resources, it has been hinted repeatedly, and is now authorita-

Digitized by Google

tively announced, that Government has nothing to spare for Ragged Schools. There is a distinct class of children for whom the Ragged School is the only means of education. The parents of this class belong either to those who cannot, or to those who will not educate their children—a very large proportion to the former. The parents are in a state of destitution bordering on pauperism, and the Ragged School, which receives and educates, and partially maintains the children, is the means of preventing the whole family from becoming, as paupers, a burden to the State. It is now well known that pauperism has the strongest tendency to become hereditary. The children of the workhouse are constantly found returning to it, and their children become its inmates for generations. Again, the children of those who refuse to fulfil their parental obligations are exposed to all the temptations which usually lead to a life of crime. Not only neglect but cruelty is often their portion, and the prison becomes their refuge from the street, into which the furious drunkard who is the tyrant of the den they have called a home has driven them. The taint of criminality is acquired, and it may be the taste for it also, and a costly burden of punishment, but little deserved, or of reformation, is laid upon the country. Surely it is the interest and duty of the State to encourage and aid institutions which interpose an effectual barrier to this flood of demoralisation, which save the neglected children from the taint of crime, and train them to habits of industry. To no class of institutions is voluntary help so freely given, or voluntary agency so beneficial, and to none could the Privy Council system be more reasonably, and with such happy results, applied.

If we are reluctantly compelled to question the wisdom of the Privy Council system, we are able to accord the praise of entire success to another experiment by the State. The educational clauses of the Factory Acts have embodied that wise legislation which steps in to remedy a wide evil, and enunciates a general principle, without crippling the action of individuals, either by injudicious interference, or enervating help. The early industrial training which, under the half-time system, goes along with mental development, is the best possible education for those who have to win their bread by manual labour; and to this system, enforced by legislative enactment, and constant inspection, the immense improvement of the operative population engaged in textile manufacture, is chiefly to be attributed. Efforts are now being made to extend the principle of the Factory Acts to other branches of labour, and Mr. Adderley has recently introduced a Bill for that object. The ultimate success of such a measure will probably be secure if its promoters will consent to confine its provisions within practicable limits.

If anything could be more encouraging than the success of factory legislation, it would be the self-supported exertions of the operative classes to obtain an enlarged education for themselves in adolescent and adultlife. What universities and colleges are to the young men of the richer class, that are mechanics' institutes and working men's colleges to the artisan. The number and prosperity of such institutions is truly astonishing. In Yorkshire alone there are 138 mechanics' institutes, with upwards of 24,000 members; and in many other parts of England scarcely less activity is shown. This, after all, is the great educational feature of the age. The people, roused to a sense of their own wants, have begun to educate themselves, and we may trust that hence a noble spirit of self-dependence will be generated, which will cause every class to rely on their own efforts, and make their own sacrifices, to secure a fitting education for their children. To that great end every effort of the statesman and the philanthropist should be directed, for a true national education will never be securely attained till it has taken root in the popular mind, as its native soil, and flourishes there spontaneously without forcing or external aid.

G. W. Hastings.

INDUSTRIAL SCHOOLS FOR LADIES.

That "example is better than precept" none will trouble themselves to deny; to be the example of a given precept in their own persons is quite another matter, and it is in all deference to the enlightenment of the age we live in that any suggestion of industrial occupation for ladies is made. We do not regret that bygone standard of what a gentlewoman's library should be "the cookery-book and the Bible," or hail with any sort of satisfaction such modernised revivals of it in domestic literature as "The Wife's own Cookery Book." This much, though, must be said for that old-fashioned library, that if it afforded narrow reading, it often produced deep thinking, and brave action. The "Dame" of those days had a busy life of it, and cared nobly for the bodies and souls of her household. As in domestic, so also in territorial jurisdiction, the trumpet of her judgment gave no uncertain sound; and, at need, she who had ruled wisely among her servants in peace and plenty made no bad general when danger or distress beset her people. We conceive that this temper of character in the Dame of old was not produced by reading little, but by acting much; and we fear that the student of cookery who enters upon her art with a view to gratifying the palate of one man, will never get far beyond the narrow sphere in which she has begun.

But, seriously, we spend time and thought, many words and much money on industrial schools for girls of the working classes. Gentlemen, clergymen, picked men for intellect and education, visit and inspect girls' schools throughout the country, and the conclusion drawn from the statistics of their experience is, that few of the girls who have passed creditably through these school enter service; and it is admitted by good authority* that "our present course of school training certainly does tend to give girls a distaste for housework."

Now, if we investigate further into this distaste for housework, whether on the experience of qualified inspectors or that of thoughtful housekeepers, we shall find that it is thought meanly of in itself, as a thing to be done by those who can do nothing better; and that shop-serving, millinery, or dress-making, are dignified to the imagination as skilled labour, while housework is supposed to be a manual labour among raw material, upon which no girl who could qualify herself for a better position would be justified in wasting herself and her education.

This, or something like this, is the root of distaste for housework in itself. There remains to be considered the dislike to doing housework in other people's houses, or, as it is called, to "service," before we arrive at the proposed remedy for both evils.

The objectors to service may be briefly divided into those who are above and those who are beneath it, who are too fine or too rough. Of the first and smaller class most are influenced by the same feeling that makes them dislike housework, they are ambitious of what they conceive to be higher; but of the masses of the latter class who prefer slopwork at starvation pay, oakum-picking in a London workhouse, or sin itself to the restraints of service, one and all are influenced by the same objection, the loss of their liberty.

Here, then, are two definite objects to attain—to make housework more honourable, and service more attractive. How is this to be done, and by whom?

* Girls' Industrial Training. By the Rev. J. P. Norris, late Fellow of Trinity College, Cambridge, and one of H.M.'s Inspectors of Schools.

Digitized by Google

If we could effect the one we should have done much towards the other, but in order to effect it we must prove household labour to be honourable in itself, not simply assert it to be honourable in the lower orders. There is no difficulty in procuring lady's maids and nursery *governesses* from the very same classes who ought to furnish cooks and housemaids,—though the amphibious position of a governess who is not a lady must be tenfold more irksome than that of a simple servant, and the duties of a lady's maid require more tedious physical labour, and more moral subserviency than those of a housemaid;—but these offices are held more honourable, therefore they fill.

To raise the dignity of labour, then, would win the better class, who are now damaging the market of educated female labour by attempting shop service without competent arithmetic, and teaching without the capacity for educating. But for the masses who are neither competent for domestic service, nor willing to enter it at present,—how could we persuade them to be trained, or train them when they were persuaded? Only by making a servant's life more independent and more remunerative.

By whom is the "nobility of labour" to be set forth, and the liberty that none but a diligent ruler dare allow, to be given?

By ladies, and ladies only; by gentlewomen whose position as such is unmistakeable. What they do,—what they are—thousands of their countrywomen imitate for good or for evil. Is not the dress of every grade of society an increasingly caricatured copy of a lady's? Is not the drawing-room life of a lady's home counterfeited in the parlour behind the shop, or over the farm-yard? If a lady of rank were to sweep a room, though it were but with a silver-handled broom, while the page held the dustpan, many less costly brooms would find their way into many hands that would be none the worse for using them.

But ladies do not know how a room should be swept, and any amateur performance by which they displayed their ignorance would do more harm than good among their servants. Therefore they must have servants who are ready trained, and on whose industrial capabilities they are thus too dependent. How often do they tolerate servants in daily intercourse with themselves and their children whose moral character they distrust, because these servants know that routine of conventional service which ladies could not teach to better women if such offered themselves.

We do not state unconditionally that ladies are unable or unwilling to do, on occasion, many kinds of household work; we believe that the common sense of an Englishwoman would teach her how to do any one thing on an emergency, and to do it in a first-rate manner; but this we do state—after inquiry of many ladies, fashionable and unfashionable, rich and poor, public minded and private minded—that very few know how the details of their own household labour ought to be executed or arranged. Many know what effect ought to be produced, how their rooms should look and their table be served, and some few know the causes that produce it, and where to lay the blame when things go wrong. They know whose place it is to do certain things, but how and when they should be done, what time they take, and what expense they ought to involve, they do not know. Consequently, if a lady is rich and has many servants, she cannot tell if her under servants are over-worked, or her upper servants honest. She may teach her little kitchen-maid the Catechism, or hear her read the Bible, but she cannot know what chance the girl has of *doing* "her duty in that state of life to which God has called her;" she may elevate the cook's sense of honour with the key of the store-room, or the credit of the tradespeople, but she cannot really know if the trust is abused. And comfortless, indeed, is the condition of a poor lady who cannot tell how to produce that perfect cleanliness and order which is as necessary to her daily comfort as to that of her better-served equal.

We do not propose that mistresses of households shall go to school, they have all bought their own experience, and learnt to manage, or be managed by their servants in some way or other. Neither servants nor ladies could very well alter or be altered in this generation, and many would not even agree that the existing system needed any alteration.

But there are some few ladies—and gentlemen—who *will* care for right and wrong for its own sake, who will ask if every one under their roof has fair play and right influences, who cannot be satisfied that their under servants shall suffer physically or morally now because their turn will come and they will in time be able to inflict what they have endured. And there are gentle-people of limited incomes who will feel annoyed that they have no money for many good uses or lawful refreshments because their style of living consumes it all, and they do not know how to continue the habits of their station around their children with less expensive and more controlable machinery.

These will agree that some practical knowledge and manual experience of household labour would be valuable in itself to a lady's own comfort. *Punch's* caricatures on "If you want a thing done, do it yourself," did but exaggerate a truth. What we could do well ourselves, we will not allow to be ill done for us by others. Moreover, what we know to be well done, we cannot *suspect* to be ill done. Most great households are ruled by distrustful precedent, because the mistress is too ignorant of detail to exercise discretional authority. She holds fast one or two traditions of expediency, never to allow this, or always to insist upon that, but whether they be practically true or false, just or unjust, she could not prove; and whichever they are, she dare not relax them.

But a lady who in girlhood had passed through the manual exercises of household work, which are then as easy, and to many children as agreeable, as bodily exertion of any other kind, would be in a very different position. She might or might not take pleasure in such accomplishments, she might like teaching and helping young servants, or she might prefer them already taught, but she would never be dependent on their knowledge, neither would she be so painfully dependent on their services as to be, what so many employers who give high wages are, "stingy" of holidays, and unable to "spare" a servant for a day. If this were a new theory, if ladies had never been what for the benefit of working women we desire to see them again, we should fear to suggest what might be offensively construed, as though we said, "Go spin, you jades, go spin." But when we recal the strength and beauty of daily life that was in some of the past or fast passing generation, the bountiful rule, the Christian hospitality of the "lady of the house,"—as she who governed its details in the spirit of her own mind might well be called, and contrast it with the vulgar struggle for appearances of the present day; when we know, too, that these women did this with narrower prejudices, narrower reading, and worse machinery than our own day would tolerate, we cannot help thinking what would not the present generation of English girls do in their own homes if they only knew how to set about it. Girls who learn everything that is to be learnt, and fear nothing that it is to be done, who can boat, and ride, and dance, and walk away animal energy enough to set a whole house to rights from

Digitized by Google

attic to cellar, and dress for a ball afterwards. And what they, the gentle-born, do, the simple will no longer be so very simple as to despise. Mr. Norris tells us that the great difficulty in industrial training is "the opposition of the parents." Another gentleman, in a report on popular education at Liverpool, says, "the industrial training of girls is very urgently demanded on all sides," and proceeds to state the difficulties of mixing it up with ordinary schooling. He suggests, "I do not see why establishments for practically teaching these things should not be set up in such neighbourhoods as to be within reach of several schools, so that the elder girls from all might be drafted off in turns to receive practical household instruction under a superintendence limited to this one object." Upon this suggestion, and the practicability of combining with it the instruction of the upper classes in the same household arts, we must take another opportunity of enlarging, and may urge in conclusion, on better authority than our own, the benefit to others, and the satisfaction to self that the power to lead industrial work might confer.

Borrowing again from Mr. Norris's paper:—"And here I venture to throw out a suggestion which may perhaps be taken up, tested, and, if desirable, carried out by some among the many excellent women who, in the present day, are to be found almost everywhere, ready to occupy any opening that may appear in the work of elevating our poor neighbours. The presence of one such gentlewoman in this home, who would throw her spirit into the domestic training of the girls, and infuse some of George Herbert's elixir into their housework, teaching them that

> A servant with this clause
> Makes drudgery divine;
> Who sweeps a room, as for Thy laws,
> Makes that and the action fine—

such a presence would give to our girls precisely what we most want for them—a sense of the gracefulness and dignity of household ministration."

Also Mr. Ruskin, in commenting on the scriptural description "of the perfect economist or mistress of a household," her activity and her forethought, draws a picture which, if it seems to the high-pressure civilisation of modern manners impracticable in actual life, is at least, as a picture, a very beautiful one of the power of a good woman.

" . . . And when the evening came, and she dismissed her servants to their recreation or their rest, or gathered them to the reading round the work-table, under the eaves in the sunset, would you not be sure to find that none of them had been overtasked by her, just because none had been left idle; that everything had been accomplished because all had been employed; that the kindness of the mistress had aided her presence of mind, and the slight labour had been entrusted to the weak, and the formidable to the strong; and that as none had been dishonoured by inactivity, so none had been broken by toil."

What can each of us do in our day to right the great wrong that while half the women in the world *are* "dishonoured by inactivity," the other half are "broken by toil"?

Reviews.

The Health of the Parish and the Dwellings of the People: Practical Hints on the power of protecting the poor from illness, especially in large towns. Published by the Ladies' National Association for the Diffusion of Sanitary Knowledge, at their office, 14A, Princes-street, Cavendish-square, W.; and for the Association by Jarrold and Sons, 47, St. Paul's Churchyard.

THIS is one of a series of tracts published by the Sanitary Association. We select it from the others for especial consideration because its title indicates, and its pages contain, the pith and essence of the Association's object in publishing the whole series. Many of that series are better calculated for distribution among the poor themselves, being intended to persuade their readers of truths that to educated persons require no arguments, such as "The Worth of Fresh Air," or "The use of Pure Water;" or to beguile them through a pleasant tale into the tolerance of a new idea, as in "The Cheap Doctor," and "The Power of Soap and Water:"—but "The Health of the Parish" is a handbook of sanitary information to the visitors of the poor. It is rare for persons of refined habits and delicate senses to enter a poor man's dwelling, in London or any large town, without some annoyance to their organs of smell or respiration. Perhaps the sensation of a difficulty in breathing is more frequent than the definite perception of any unwholesome smell amounting to a *nuisance* to be informed against; but there are often olfactory evidences of uncleanliness, over and above the mere *closeness* of an ill-ventilated room, which this book would enable any one perceiving them to trace to their causes, and to ascertain if the causes are remediable by Act of Parliament.

From the four Acts which bear upon the public health practical hints are drawn up, enabling any one to decide whether any particular evil comes under the power of the *local authority*, and to inform themselves in whom the local authority for their own district is vested:—

"The 'local authority,' whatever it be, is bound by the Nuisances Removal Act to institute inquiry as to any nuisance of which they may have received notice from 'any person aggrieved thereby;' or from their own officers, or the police, or any two resident householders; and for this purpose is compelled to appoint an inspector. Moreover, the Metropolis Local Management Act concurrently requires every local authority in London to appoint one or more inspectors of nuisances, whose duties are to see to the proper execution of the scavenger's work, to report any nuisances, keep a book in which he is to enter all complaints of nuisances made by any inhabitant, and to inquire into and report thereon.

"There is, moreover, in every Metropolitan parish or district, a physician or surgeon appointed medical officer of health, whose duty it is to point out the existence of any causes likely to affect injuriously the health of the inhabitants, and advise the local authority generally on all points touching the health of the population.

"When complaint has been made to the local authority of any matter affecting health, and the inspector has examined into it, the medical officer of health brings the case, with his opinion thereon, before the next meeting of that committee of the vestry or district board which is appointed the local authority to carry out the Nuisances Removal Act. Then the committee, if satisfied by the report of their officers of the reasonableness of so doing, are bound to take proceedings to remedy the thing complained of; provided always, of course, that it is one of those things which they have power to deal with."

To find out the *inspector of nuisances* seems the first step to be taken when residing or visiting in an unhealthy or densely crowded district, for his experience will enable him to give much advice and assistance even in cases not absolutely within his official jurisdiction.

The medical officer of health has wide and discretional duties, and much depends on his personal zeal and activity: something, too, on his good understanding with the inspector, whom he depends upon for removing the cause of disease when found, and sometimes for finding it when suspected.

"It will be readily seen that the powers and responsibilities of the local authority are very great.

"As to their powers. They can, by their officers, demand admission between 9 A.M. and 6 P.M., and enter and inspect any pre-

Digitized by Google

mises complained of, to see if the grounds of complaint be reasonable. They can go in with workmen, and ascertain the course of drains, and examine whether any works ordered by any justice have been properly executed, and the nuisance complained of be abated; they can inspect and seize unwholesome meat, poultry, game, fish, fruit, corn, vegetables, flour, or bread; and in either of these cases, if resisted, they can obtain power of entry and seizure from a magistrate.

"As to their responsibilities. The law throws upon them the duty of protecting the inhabitants of their parish or district from all tangible causes of ill health occasioned by the act or neglect of any one. If the friendly notice which they issue, requiring abatement of a nuisance, be not obeyed, they relieve themselves of responsibility by appealing to a magistrate. If there should be delay in removing a nuisance, because the person liable cannot be found, or cannot or will not abate it, the magistrate may require the local authority themselves to enter and do everything requisite for abating the nuisance; and they may recover their costs from the owner of the premises, and sue him for penalties afterwards, to reimburse themselves."

Having ascertained to whom to complain, we leave the matters against which complaint may be made. Such are sewer nuisances, vegetable or animal deposits in ashpits or dustbins, animals kept in places or in a condition to involve causing offensive smells, leaky roofs or walls, defective pavement in yards, want of proper water supply in *covered* receptacles, and *overcrowding*. Trade nuisances and neglect of vaccination are also grounds of complaint.

The author thus urges "the expediency of making complaints:"—

"No person, therefore, need refrain from making reasonable complaints through fear of being invidious or unneighbourly; for the local authority will satisfy itself of the reasonableness, before taking any steps in the case.

"Neither need any one be deterred by fear of expense or personal trouble; for in the few cases in which legal proceedings before a magistrate are necessary, these proceedings are carried on by the local authority, at their own cost, and by means of their own legal adviser and officers, who, moreover, being the chief witnesses, seldom require the testimony of other persons.

"There is no reason, therefore, why any person should not appeal to the local authority when his own home is rendered unwholesome by nuisances created by his neighbours. For example, a gentleman's house had been rendered offensive for years, because a neighbour had made use of a common old leaky rain-water pipe, enclosed in a groove of an old thin wall, which formed part of the outside of the complainant's house, to carry away offensive water from a sink. Private remonstrances, and lawyers' letters, did no good. But at last the local authority was appealed to; the inspector certified as to the facts; the medical officer of health as to their injurious influence on health; the notice which was issued, and one or two private letters from the medical officer of health, were met by attempts to raise other issues; and so the local authority appealed to the magistrate, who, after hearing, the case, ordered the pipe to be removed. Thus, as the magistrate observed, a case, which under the old system would have been brought into one of the superior courts, where attorneys, counsel, and a host of witnesses would have occupied a day in swearing and counter-swearing, as their manner is, at an immense outlay of anxiety, trouble, and money, was settled quickly and satisfactorily to all parties at the cost of two shillings, paid by the defendant.

"Still more should benevolent persons make use of these legal powers for the protection of the poor. Clergymen, who sit for half an hour perhaps reading or praying by the bedside, should for their own sakes be complainants, for they are much more likely to suffer than medical men, who after they have once thoroughly investigated a case, seldom require more than a few minutes to ascertain how it goes on; and district visitors and others, who desire to raise the moral character of the poor, should complain of anything which tends to keep them in a debased condition. Above all, the governors of hospitals, dispensaries, and other institutions for relieving sickness, should make complaint of any houses from which patients are sent to them with diarrhœa, fever, and other disorders possibly arising from putrid miasmata. How absurd it seems, to provide the services of physicians, surgeons, and apothecaries, with drugs and other remedies for the relief of diseases arising from known physical causes, instead of removing the causes themselves. For instance, a poor woman, who lived on the ground floor of an unhealthy house, was confined to her bed by illness, for which the physicians of a dispensary paid her every skilful attention, and supplied her with medicines. During her illness, the clergyman, sitting by her bedside, was almost overpowered with offensive effluvia, and sent a complaint to the medical officer of health. This was attended to by the inspector, who found an open cesspool in a cellar under the woman's bed, which had been left in this state by a scamping tradesman, who promised to cleanse and repair the drains. The clergyman by his complaint did more good than the physicians could do with their medicines.

"Besides, it is unfair that the funds of public or private charity should be expended in alleviating illness, caused by unwholesome condition of habitations, if that condition can be remedied. Moreover, all alms should be withheld from persons who wilfully persist in living in dirty, unwholesome places, if they can remove; for it is believed that some do so in order to excite commiseration, and the relief they get goes into their landlord's pockets, in the shape of rent.

"The foregoing observations will serve to define the class of persons and of houses, in respect of which the interference of the local authority should be called in.

"For example: if Lord A., or if Mr. B., the rich tradesman, choose to occupy a dirty, unwholesome house, no one can or need hinder them. But if Lord A. send a servant to die in an hospital, of typhoid fever, caught in an unwholesome sleeping place, or if the workmen in Mr. B.'s factory are made ill by close stifling air and foul drainage, and apply to the parish doctor or dispensary for relief, then it is quite just to interpose, and insist on the removal of the causes of ill-health, which render these poor people chargeable to the rest of the community.

"So also, if a man choose to live in a poisonous house, let him. But he must not take in lodgers or inmates; and any person who has experienced any real nuisance at a lodging or hotel, would do well to complain to the local authority on behalf of others who may come after.

"Any person, then, who desires to benefit the poor, or to benefit himself by keeping down the poor's-rate, will do a public service, by informing the local authority of anything which may reasonably be believed capable of producing illness. Still more will he do good if he encouraged the poor themselves to complain; and to put themselves into a condition to do so by thrift and temperance. For it is only people who pay their way that dare complain; they whose rent is behind-hand are obliged to put up with dirt, damp, and nauseous smells; and if they grumble, their 'things' may be seized, and themselves turned into the streets."

But when inspectors and Acts of Parliament have done their work there will remain what the law cannot alter, and only public opinion can—bad habits and strong prejudices:—

"All the grosser nuisances in the poor people's houses are done away with and kept under; and there is no doubt but that typhoid fever, diarrhœa, and sore throats have been immensely lessened. Still there remain the evils of poverty and unthrift, and dwellings incurably bad, which compel the writer to say that physical remedies will be of little avail, unless the moral habits and intelligence of the population be raised, and that speedily."

How can each and all of us do our part in promoting public health? Privately every one can act through their personal example and influence, though this will rarely extend beyond their own household, and will often be up-hill work among apparently intelligent servants; but our poorer neighbours naturally confound the sanitary superiority of our dwellings and habits with other of our comforts and luxuries unattainable by them. They forget that the labourer who can clean out his own gutter, and the working woman who can scour her own house, have their balance of advantage over the gentleman and lady who cannot do such things at all personally, or only at the cost of great physical and moral effort, and they say—truly—"it is easy to talk," not believing that to many among themselves it is easy

Digitized by Google

to *do* much that would purify and improve their homes. The extension and development of private influence must be left to private judgment. On the power of exerting public influence the author speaks strongly and confidently:—

"You should recollect that in a free country, blessed with self-government, the responsibility is thrown on every citizen. The vestry are your representatives; their acts are yours. You should, if a ratepayer, attend the parish elections, and select men who represent your own opinions. No ratepayer, male or female, need be absent. Inhabitants, too, who are not ratepayers, can influence those who are; and the wishes of the better class of the community, if expressed, will have their weight. It is the clearest case of duty possible. But if, from indolence or fastidiousness you choose to shirk your share in the administration of public affairs, sit down under the curse of Meroz, but don't complain of parochial mismanagement and parsimony, for which your own apathy is to blame.

"Besides, you have no right to rail at people for acting according to their convictions. Remember that the doctrine of the origin of fevers and diarrhœa in putrid exhalations is virtually new to the public at large. It is a fact, that dirt of various kinds has been supposed, even down to our own day, to have a sort of wholesome, nourishing, and even medicinal virtue. Low nurses (though never afraid of giving gin) yet oftentimes profess that it is dangerous to change a patient's linen, or to wash him with hot water and soap. Nay, persons of general education are usually wanting in knowledge of the laws of life, and of the positive results demonstrated by statistics. Hence, it would be impossible to get up a sanitary movement in many places, unless there were a pestilence on the spot; and then the population, in a panic, would cleanse their gutters now, if bidden, just as centuries ago they would have burned the Jews, or hanged the physicians for poisoning them. Public opinion has to be created and directed; and this not by contemptuous vituperation, but by steady continuous teaching and example. And in a self-governed country, there is no one who cannot, and who ought not, assist in this work."

The Use of Pure Water contains many passages bearing on the preservation of public health, written, as the majority of these tracts are, with unmistakeable plainness, without the condescending simplicity—the writing down to the assumed level of the reader—which spoils so many books written for a class or classes of the population.

"Now you, my friend, who live in a town, have a house where sewers and drains of some sort or other have been provided, to carry away decaying poisonous filth. Accordingly you throw all waste matters into these drains, and think that is all you have to do, and that you have got rid of them as it was meant you should, and have put them quite beyond the power to do you harm. In this, however, you may be altogether in the wrong: too often you have done nothing of the kind.

"Waste matter has no legs, or wheels—it can neither run nor roll away. It will fall *down*, so far as it can get, but it will not *move onwards*, unless driven, or forced to do so. You know very well that if you want a spadeful of earth, or cinders moved, you put a spade or shovel under it and lift it up, and carry it away.

"The waste matters that are put into the sewers and drains must also be carried away through them; otherwise, having fallen into the drain-pipes, they will go as far down them as they can, and then will lie there choking up the passage, and preventing everything that is added from passing further that way. But you say, how are you to make them pass on if they choose to lie there so obstinately, after you have thrown them in? That is the point to which I want to bring you. There is really no difficulty in the case, if you only see the matter in the right light. Means have been provided, already to your hand, if you will but use them as it was meant you should, whereby you may drive away together the danger and the dirt.

. . . . . .

"God has taken care that the great purifier shall be so plentiful that no human being in civilised lands ever can have any reasonable ground of excuse to offer for not employing it. You say you live in a house which has had no provision made for bringing in a supply of pure water, and that you cannot afford to buy pipes, and have them laid down. But are there no pumps and wells anywhere near? Or, if there be none at a short distance, would it not be better that you should go, even a long distance, and be at the pains to fetch water thence rather than live in filth, at the risk of attack from deadly disease?

. . . . . .

"A few pails of water, brought from the nearest well, every day, and poured down the house-drains, until everything that was dangerous and bad was washed clean away, would effect all that is required. . . . . .

"Choked-up sewers are mischievous, instead of being serviceable—worse, actually, than no sewers at all—for this reason; they act as reservoirs for large quantities of decaying substance, and also of poison-vapour, which is bred from these. Many persons who are quite incapable of allowing dirt and filth to lie about in their houses, nevertheless, live perfectly contented with a great amount of the same dangerous materials gathered together in pipes just beneath, simply because they cannot see them there. Choked-up sewers are, practically, so many holes, dug into and beneath the floors, for the reception and accommodation of poison; and water-traps, at the entrance of the drain-pipes, afford no protection from the hurtful vapours that are generated in them, because water, being heavier than the vapours, drives them out of the pipes, when it runs in. The expelled vapours cannot get onwards, through the choked sewers, consequently, only one course is left to them They must rush back into the house, bearing with it disease and death.

"What would you, my friend, think of the prudence and wisdom of an acquaintance who dug snug little nests behind the skirting-boards, and beneath the floors of his house, and then filled these with vipers, which, having no possible means of getting away provided for them, must of necessity return inwards, into the rooms of the dwelling, whenever they were induced to leave their nests! Now, this is precisely what people do who place refuse substance in drains that are choked up at their outlets. The bubbles which are, from time to time, driven back through the traps, are poison-bubbles; they are like venomous vipers stealing forth into the house, from underground nests, where they had been allowed to lurk.

"There is a snake in hot countries which is of so deadly a nature, that it kills at once whomsoever it bites. This dangerous snake climbs among the branches of trees, and glides along under the grass, seeking stealthily for its prey; but God has placed some small pieces of loose gristle in its tail, which rattle together whenever it moves, and so give notice that the reptile is near. This deadly snake is thus heard when it cannot be seen, and at once avoided by all living creatures that know what its nature is.

"Now, what the rattle in the tail of the rattlesnake is to the creatures that this snake preys upon, a bubbling sound issuing from trapped train-pipes, or closets, upon water being poured into them, is to the inhabitants of the house; it is an indication of danger. A bubbling sound at the inner extremities of drain-pipes is a sign that those pipes are choked up somewhere within, and need to be immediately cleared. Never rest one minute, when you hear this warning sound, until you have traced the stealthy danger to its hiding-place and driven it away.

"Poison-vapours, however, have no warning rattles, unless when they enter dwelling-houses in this stealthy way, through trapped train-pipes. But they nearly always carry about them another mark, which just as surely betrays their presence, if it be duly noticed.

"Whenever you go near to a manure heap or an open cesspool, do you not observe that an unpleasant smell arises from it? Often this smell is so strong that it at once drives you away. Now, this disagreeable smell is a constant accompaniment of the poison-vapours of putrefaction. It is, indeed, attached to them for the most merciful of reasons; namely, that men may have timely notice of the danger that is lurking near. It is like the rattle of the rattlesnake, having been made sensible to the nose, instead of to the ear.

"Men ought always to avoid the threatening smells of putrefaction, as carefully as they do the threatening sounds of the rattlesnake. Disagreeable smells are indications of the presence of danger. Never allow them to remain in, or near to your dwelling. Never rest for a minute when you perceive them. Hunt them away from your homes, as you would the most venomous reptile that crawls.

"When people live in the open country, there is not quite so much need for drains and sewers as there is in the case of towns, because there are by no means so many

Digitized by Google

individuals crowded together in a given space, and because also, it is then always easy to take waste substances away at once, and deposit them at some distance from the house, where there are no living creatures to breath the poison-vapours which steam off from them during their decay.

"Still, even in the open country, it is absolutely necessary that decaying matters shall be removed from the neighbourhood of dwellings. If they are cast out just before the doors and windows, and left there, the poison-vapours that they breed rush into the house every time those doors and windows are opened; and if there be a fire burning within, are sucked in continuously, through chinks and crevices, in the place of pure air."

The Influence of Wholesome Drink contains an analysis of the nature and effects of the beverages in most common use. A description of the purifying and invigorating effect of pure water, or of the slow poison of ardent spirit in whatever shape it is taken, will be generally read with little interest, however well stated. People need no further persuasion of either truth in theory, and rather dislike to be reminded of them if they deny them in practice. But the description of the neutral drinks between the two extremes of plain water and fermented liquors will, we think, be interesting to most people, and new to many. Tea, coffee, and cocoa, none of them in use before the middle of the 16th century, have a property in common more needed by the present and passing generation than by their forefathers. Other properties in them, their uses and abuses, are also explained; but with an extract from the description of their common property and its supposed action we must conclude:—

"When articles, which were scarcely known to be in existence three centuries ago, have so rapidly spread themselves through the world, that they are now viewed almost in the light of daily requisites by the larger half of mankind, it may very safely be concluded that there is some strong reason for the result. The reason may be a good one, or a bad one; the articles may be found to be of great service when employed, or they may be merely felt to produce agreeable feelings not necessarily serviceable. Is it possible to determine in which of these predicaments tea and its allies stand? As a first step towards the formation of an opinion in this matter, it will be quite worth any interested person's while to satisfy himself by a very easy experiment that there is something in tea, which careless notice and common use would never discover. Let him simply rub a teaspoonful of dry tea leaves to powder, and place it in a flat watch-glass, standing on the hot hob of a fire-place, a piece of stiff white paper being twisted up into the form of a sugar-loaf, and covered over the watch-glass and powdered tea. So soon as the tea has become very hot, a white steam-like vapour will rise from it, and be entangled in the paper, and if the paper cap be removed after a few minutes and be unfolded, its surface will be found to be sprinkled with a white glittering powder, something like pounded glass, or very fine salt. The powder is the vapour, turned into the powdery state, after it has been entangled by the paper. There is so much of this white powder in tea, that three grains can be procured from half an ounce of the leaves. Fifty pounds of good tea would furnish a pound of the white powder.

"Having found out the existence of this white powder, hidden away in the black or green leaves of tea, the next thing we have to do is to discover, if possible, what its nature and character are. The chemists have given it a learned name—that will not help us much in our present proceedings, still it may be convenient to know the curious substance by the title it bears among learned men. The chemical name of the white powder is Theine. This means nothing more than the white powder contained in tea. There is another really helpful consideration, however, which naturally occurs while we look at this substance, 'Where did the white powder come from?' How did it get into the tea-leaf?

"The white powder of tea was formed in the leaf when that leaf was stretched out in the Chinese sunshine, as the plant grew on the side of the warm Chinese hills. It was made out of the food which the plant sucked in from its native soil and its native winds, in the little chambers of its living structure, at a great expense of wise effort and skill. No human artist can make a grain of that white powder, if he spends a life-time in the trial. In the little tea-leaf, as it grows on its sunshiny hill-sides, the most subtle and cunning powers are set to work by the wisdom which knows everything, and by the hand which holds and directs all things in man's wonderful world. The result is, that out of coarse earth, and thin vapours, and fostering sunshine, the ingredients of the white powder are gathered together, and mixed, each in its proper proportions, and in the right manner, in the hidden recesses of the growing plant. God, in His own sublime language, says to the Chinese soil, and atmosphere, and sunshine—'Let the white powder of the tea plant be'—and there it is.

"In a world that is so overflowing with perfect contrivance as this one, which serves as man's dwelling place, it is not at all likely that this curious white powder is made by the tea plant in such abundance—twenty-five thousand tons of it at least turned out on the Chinese hills every year, and scattered thence to the four corners of the world—without having some very good work appointed it to do. You will not wonder, therefore, that inquiring men, who know that all these thousands of tons get mixed in the ordinary course of ordered events with the flesh and blood of human bodies, should be very curious to find out what they are capable of doing there. Another very surprising fact also tends greatly to strengthen this curiosity. The coffee tree grows not in China, but in Ceylon, in Arabia, and in the West Indies. The cocoa tree flourishes on the other side of the American continent, in Mexico and Peru. Yet the coffee and cocoa plants make out of the East and West Indian, the Arabian, and the South American soils, vapours, and sunshine, exactly the same kind of white powder that the tea plant manufactures on the Chinese hills! Plants so unlike in external appearance, and living in districts so remote from each other, first get to be used in similar ways in the preparation of beverages for millions of the human race. Then curious and prying inquirers find that there is one principle present in all these beverage-yielding plants. The common sense inference is plain. It is most likely that it is this one substance present in all the three different plants which has led to their being employed so generally in the preparation of drink.

"The experiments which the chemists have tried with this white powder, with a view to the discovery of the action it may be able to exert upon living bodies when taken into them, appear to prove simply this. When swallowed in proper quantities it has a most wonderful sustaining power. It seems as if it enabled food which is taken with it to go one-fourth part as far again in supporting the strength of the body, as it would without the addition; and if it does this, it is certainly not because it adds an equal amount of bulk to the food, for a trifling pinch of three or four grains of the powder, as much as could be laid on a silver fourpenny piece, is enough for the purpose during one day. If a healthy man has half a pound of bread taken from his daily meals, and three grains of the white powder of tea added in its stead, his body does not miss the bread. The white salt of tea, coffee, and cocoa seems to possess the power of relieving the body from the effects of wear and waste, and so of decreasing its requirement of food.

"This extraordinary substance also produces another very remarkable effect on the living body, when it is swallowed in these small quantities. It cheers and enlivens, at the same time that in aids in supporting the bulk and strength of the frame. The chemist finds, when he examines its precise composition, that it is even more adapted to supply the substance which the nerves and brain lose by wear and tear, than to diminish the loss the flesh undergoes from the same cause. The white powdery ingredient of coffee and tea is most probably a rich and strong nerve-food, provided for the support of the nervous structure and brain, rather than for the nourishment of the flesh; it is nerve-making substance rather than flesh-making substance; and it exerts some mysterious and very extraordinary influence of lessening the waste of wear and tear in the structures of the living frame, without stopping their useful activity in the same degree.

"In order that the nature and suspected action of this white powder of tea, coffee, and cocoa may be kept fairly in the mind, it may be well, instead of speaking of it by its learned name, to call it the nerve-food ingredient of these beverages."

The Journal of Prison Discipline and Philanthropy. E. C. & J. Biddle & Co., Philadelphia, 1860.

We have before had occasion to notice this Quarterly Journal, which is published under the direction of "the Philadelphia Society for Alleviating the Miseries of Public Prisons." An article in the April number, on *Schools of Industry*, contains an account of a scheme for a new reformatory, under the name of the *Penn Industrial Reform School*:—

"We have already two Refuges or Schools of Reform, one at Philadelphia, and the other at Pittsburg. They are both sustained in a large measure by appropriations from the public treasury, and are both designed to provide for children and youth who have fallen, or are likely to fall into vicious and criminal practices. Both institutions are inclosed with walls to secure the safe custody of the inmates; the commitments are under the forms of law, and though the general character of the discipline is parental, and the advantages afforded for good training are invaluable, it is not claimed that the system is perfect, or that nothing better can be accomplished. The new house of refuge at Philadelphia has never been full, and there is no doubt that there are thousands of children in that city to-day, whose removal thither would be an inestimable blessing to themselves and the community. Whatever other and even better schemes of reform may be started, the utility of the present Refuge is sufficiently demonstrated by its past history to warrant the use of it to its utmost capacity, and to warrant the support of it to its utmost need. We do not understand the new project to be in any sense a thing of opposition or rivalry, but rather as supplementary.

"It is admitted that the more entirely a school of reform can be divested in its structure of all prison-look, the more nearly a resort to it can be voluntary, the more it can be made to have the appearance and character of a home, and the more the occupations introduced can be such as will fit the parties for outside life—the better; and the problem is to combine these desirable aims with the principles and purposes of such an institution. Some degree of restraint seems indispensable. Boys accustomed to roam through the streets by night and day, truants from school and from home, inured to every kind of petty vice, and glorying in dirt and mischief, are not likely to bend their steps from choice to a place where all their depraved habits and inclinations will be systematically counteracted, nor will they long remain on such premises if escape is practicable. Taking this class of boys as they are in our country, we apprehend that the attraction which any School of Reform will present to them will require some external pressure to produce cohesion.

"It has been an evil in our Houses of Refuge that they have been too often used to supply the place of a convict-prison for young criminals. It was the frequent commitment of those in tender years to the common gaols of the country, where they were thrown into the company of callous men, that opened the eyes of the community to the necessity of a separate place of restraint for such parties, where the defects of early education might be supplied and good habits formed. But it is a mistake to make it a common place of reception for the young felon as well as for the truant schoolboy, or the disobedient and perverse child of a passionate and perhaps vicious parent. It is a mistake to put an honest and truthful, but stubborn boy, into the same school, workshop and playground, and under the same discipline with the thievish, lying boy, who always obeyed his parents, and never more cheerfully than when they told him to steal. No two methods of cultivating an acre of ground can be more diverse than the proper modes of dealing with these two inmates of a reform school."

This is perfectly true; but though boys convicted of crime may be separated as *Reformatory* subjects, from those whose vagrancy or unruliness make them more suited to a simply industrial school, any further attempt at classification as to "school, workshop and playground" is scarcely practicable. A family often contains children requiring as opposite treatment as those gathered from many families into the common home of a public Refuge. The sound judgment and zealous affection of the parents can alone adapt the discipline of the common regulations to "the individuality of the individual." Where this is done more good than harm should ensue from the action of character and temperament on their opposites. In this the writer of the article would agree:—

"So far as an Institution for the correction of juvenile delinquency can be made to wear the appearance, and supply the purging and chastening influences of a good home, its prospect of success is all that could be desired. But for this purpose it must have in its constituent elements some resemblance to the family. There is natural affection—a principle stronger than death—and there is dependence, and there is a community of interest and name and kindred; all these are incapable of transplantation. Something resembling them may, perhaps, be introduced, but not when coupled with the idea of compulsion and restraint.

"The *Penn Industrial School*, we fear, has opened too wide a field for successful cultivation on the 'home' plan. They propose to embrace in their family what we apprehend they will find very incongruous elements. They are 1. All such as are now liable to be sent to Houses of Refuge, to the same extent, in the same manner and on the same conditions. 2. Such as are charged with crime, without regard to age, who may be adjudged by the court fit subjects of reform. 3. Such persons as the legal authorities of the present Houses of Refuge shall determine to be fit subjects of their care and guardianship. 4. Such as may be committed to them as vagrants, idlers, intemperate and disorderly persons. 5. All such intemperate or vicious persons as shall, of their own free will, or at the request of friends, resort to their care and guardianship. And by a specific reference to these various classes, made in the report of the executive committee, we are led to suppose that the arms of the industrial school would be open to convicts who are pardoned, and even for discharged convicts! The committee regard the Industrial Reform School as the only Institution that can supply the means of meeting their obvious wants. And as an asylum for inebriates, they think the one now in progress near Bingampton (New York), upon a large scale—of expense as well as accommodation—'does not compare with the simple Industrial School, either in economy or the extent of practical usefulness and efficiency.'

"We long since entertained and expressed in this journal the opinion that our Reformatory Institutions for children and youth were seriously defective in their industrial department. There are so few branches of mechanical labour to which their age and strength and skill are adapted, and what there are present so little that is exciting or agreeable, or that promises to be of any use to them in after life; and, withal, the necessary confinement is so irksome and unnatural, that one cannot but earnestly desire the discovery of some system that shall obviate this disadvantage, and still accomplish the great object—the breaking up of bad, and the establishment of good habits. A country location, removed as far as practicable from those hotbeds of vice and misery—large cities; a farm extensive enough to allow the greatest variety of labour for every degree of strength and skill; a plan of employment that shall give not only excitement to care and industry, but crown them with a present, sensible reward; an oversight, constant, and yet not annoying, combining affection and confidence with exact and uniform adherence to right for its own sake; and a fair prospect of respectability and competency when the period of probation ends, these, so far as the externals are concerned, would constitute our outline of a Reformatory School for American boys. Such an Institution, with a corps of qualified caretakers, ought to be attractive, and ought to retain its beneficiares without walls or 'keepers.'

"The report before us regards it as a leading principle of vast importance, that 'no inmate is forced or compelled into the custody of the Institution.' Those only come who choose to come. If the resort to the school is voluntary, and no restraint is imposed except that which the predilection and obvious interest of the inmates supplies, we have no doubt the largest accommodations they can provide will be fully occupied. Refuge boys will be glad to exchange the workshop and yard for the open field. Vagrants, inebriates and disorderly persons must be very stupid if they refuse such a desirable country residence. Convicts will be forward to accept a pardon, on condition that they will make one of the reform family and submit to its rules; and those who are discharged upon the expiration of their sentence could ask no more agreeable retreat. It will be an extraordinary group, but love and labour

Digitized by Google

are said to be all but omnipotent, and we are not allowed to doubt that whatever they attempt will be accomplished. That essential modifications of the plan will be required we presume the friends of the measure anticipate; and the experiment must be regarded with great interest by those who have the care of the present schools. Some of the proposed improvements might be engrafted on existing Institutions. A much larger share of moral and religious influence might be introduced into daily intercourse; acts of generosity and self-denial might be much more systematically encouraged; vicious secret habits might be more effectually suppressed, and motives to uprightness, industry, and perseverance, might be more successfully urged. The great desideratum is a supply of men thoroughly qualified for such a very peculiar office, and they will never be furnished till some provision is made for the systematic training of them. We presume this to be an appendage of the Penn Industrial School."

Education in Collieries.—(*From a correspondent.*)—Yesterday I witnessed a scene here (Seaham) which I shall not easily forget, indeed I consider it of such great interest that I hope you will accord me a short space in your journal to give a short account of it. The Marchioness of Londonderry entertained to tea, in a large marquee attached to the magnificent schools here, more than 1,100 children. These children came from the schools her ladyship has so liberally provided at her own cost at the different collieries which belong to her in the county of Durham. Some of these collieries are at a distance of ten or twelve miles from Seaham, and the children were conveyed in waggons at the expense of her ladyship. A large party had assembled to witness the sight, including among the number Miss Burdett Coutts, who is at present on a visit to Seaham. A raised dais was fixed in the marquee, and the children were marched past in single file, the successful candidates for the prizes given by her ladyship receiving them at her hands. These prizes consisted of books and useful articles, such as work-boxes for the girls and writing-desks for the boys, some of them being very valuable. After the distribution of the prizes her ladyship addressed the children and teachers in a very forcible, practical, and earnest speech, pointing out the advantages of education, and advising the teachers as to the sort of education which ought to be imparted to their pupils, and suggesting a useful and practical training as being of more advantage than the mere ornamental. Her ladyship also spoke of the evils that arise from the fact of parents sending their children to work too soon, before they have even attained the rudiments of learning (a practice, I am sorry to say, which is too generally followed among the mining population of these districts), and concluded by expressing an earnest and almost affectionate solicitude in the welfare of those in her employ. My object in making this communication is to draw the attention of the public to the exertions which this philanthropic lady has made, and is continually making, towards improving the moral, social, and religious welfare of her dependents. She does not delegate her authority in these matters to others; but sees that all arrangements with regard to the education of her workpeople are faithfully and energetically carried out. By personal inspection she watches the rise and progress of her plans, and the satisfactory result is a great, a very great improvement, both morally, socially, and religiously, among the working population over which she has control. No one would believe the difference which a few years have made in this respect, and it is a great incentive to future exertions that such happy results have been attained. No one could witness the scene yesterday without a feeling of grateful pride to see so many happy-looking, well-dressed children gathered around this patrician lady, receiving at her hands the reward of their mental labour; and when we consider that nearly all these must some day become pitmen and the wives of pitmen, the prospective good that must be eventually attained is a prospect very cheering to the minds of those who take an interest in these matters. I hope you will allow this communication to appear in your columns, in the hope that the conduct of the Marchioness of Londonderry in this instance may stimulate others in her position to follow her good example.—*Times*, August 4.

Pauperism. — The returns respecting pauperism in England and Wales continue favourable. The numbers relieved at Midsummer (785,015) were 6·1 per cent. (50,599) less than at Lady-day. The number of paupers in receipt of relief at the close of the first half of this year was less by 2·24 per cent. than in 1859, and by 5·90 per cent. than in 1858. In the North Midland, North Western, and York divisions, comprising the districts in which the principal manufactures are carried on, the decrease was 6·02 per cent. as compared with last year, and 14·98 as compared with 1858. The recent returns have been least favourable in the South Midland division, in which the pauperism continues rather to exceed that of last year; and the Welsh and Eastern divisions also cannot give so good an account of themselves as the rest of the country. A few parishes, 286 in all, being under Gilbert's Act, or still under the provisions of the 43rd Elizabeth are not included in these returns.

British Agricultural Machinery in France.—The *Patrie* contains an account of the distribution of prizes at the Agricultural Meeting at Fouilleuse (the Emperor's farm). It must be gratifying to the English people to know that the award was in favour of British manufactures. Out of thirty-nine inventions, twenty of which only were of French origin, Messrs. Burgess and Key obtained the first prize, a gold medal and 1,000f. Mr. Cuthbert, of Bedale, received a silver medal and 500f. as the second prize. Mr. Cranston, of London, a bronze medal and 300f. The prize of honour was awarded to Burgess and Key. The Emperor himself was present, and spent some time in examining the implements.

Early Closing on Saturday.—A large number of City and West-end tradesmen having agreed to close their shops at an earlier hour on Saturdays, from and after the 1st of September next, a public meeting of hairdressers, perfumers, and trades connected therewith, has been held at St. James's Hall, Regent-street, to take the above subject into consideration; Mr. H. P. Trucfitt was in the chair. The chairman, in opening the proceedings, said the object was pretty well known. For some years past efforts had been made to close the shops at an earlier hour on Saturdays. An association had been started for that purpose, with great success, but it became evident that the trades themselves should take up the subject separately. The movement had been carried on with great success by a large number of the trade in the City. In the West-end the drapers were the first to commence. The object of the meeting was, therefore, to obtain perfect unanimity among the trade. He wished to state, on the part of the committee, that they had not the slightest intention to coerce, or use any pressure to make unwilling members of the trade join in the movement. After addresses from several speakers, a resolution to the effect "that the trade should close at six o'clock in the summer and five o'clock in the winter, on Saturdays, on and after the 1st of September," was agreed to.

London and its Health.—London, says the Registrar-General, now covers 121 square miles; a square of 11 miles to its side. It is equal to three Londons of 1800. It increases at the rate of about 1,000 a week, half by births (their excess over deaths), and half by immigration (its excess over emigration). It is remarkable that in London one in six of those who leave the world dies in one of the public institutions—a workhouse, hospital, asylum, or prison. Nearly one in eleven of the deaths is in a workhouse. For the improvement of the health of London three things are to be aimed at—pure air to breathe, pure water to drink, and a healthy soil to live on. The Registrar-General observes that there are above 2,000 medical men in London and its vicinity; but they are chiefly employed in treating disease, the art of preventing it is not cultivated; it is not taught in any of our medical schools; it is not formally the subject of examination in our universities. The father of a family does not go to the doctor and say, "How can I preserve my health, make my children well and vigorous, and develope all their faculties to the fullest extent?" Imagine the 2,000 members of the most enlightened profession in the country employed in instructing the people in the way of a healthy life. How many thousands of lives would be saved every year in London! How much better and happier the population would be! A beginning of a movement has been made in the right direction, under Sir B. Hall's Act. Medical health officers are appointed in the various districts of London, and many of them are working courageously against ignorant opposition, with success. They deserve public approbation, for they have done quietly a great deal of good work, and, it is probable, have saved many lives and prevented much sickness.—*Times.*

The Philanthropist,

AND

SOCIAL SCIENCE GAZETTE.

VOL. V.—No. 65.] OCTOBER, 1, 1860. [Annual Subscription, 6s. PAYABLE IN ADVANCE.

REFORMATORY AND REFUGE UNION.

PRESIDENT: The EARL of SHAFTESBURY.
TREASURER: ROBERT SMITH, Esq., 1, Lombard-street, E.C.
HONORARY SECRETARIES:
ROBERT HANBURY, Esq., M.P., 10, Upper Grosvenor-street, W.
STEPHEN CAVE, Esq., M.P., 35, Wilton-place, S.W.
BANKERS:
Messrs. SMITH, PAYNE & Co., 1, Lombard-street, E.C.
Messrs. RANSOM, BOUVERIE & Co., 1, Pall Mall East, S.W.

Contributions are earnestly solicited for the following purposes:—

GENERAL FUND.—For maintaining the general operations, corresponding with the various Institutions throughout the country, procuring the admission of convicted or destitute persons into suitable asylums, publishing Handbooks of information, and generally assisting in the work of Reformatories.

REFUGE FUND.—For making Grants towards the support of existing Institutions, and aiding in the formation of new ones where found necessary; contributing towards the Emigration of those whose good conduct has commended itself to the managers of the Institutions where they have been located; and in other ways assisting the Houseless and the Destitute.

FEMALE MISSION FUND.—For maintaining a Mission to the Fallen Women of the metropolis, and, as may be found practicable, of the country at large; to employ Female Missionaries to labour amongst them; to give donations with cases admitted to the Homes by their instrumentality; and to assist by Grants the Institutions established for the reception of this class.

Further information may be obtained by reference to the Publications of the Union, to be had on application to the Secretary.

A. O. CHARLES, Secretary.
Office of the Union, 118, Pall Mall, S.W.

REFORMATORY FOR JUVENILE MALE CRIMINALS under 16 years of age.—The HOME in the EAST, Old Ford, Bow, near London.

PRESIDENT,
THE EARL OF SHAFTESBURY.
TREASURER,
JOSEPH CRANE, ESQ.
BANKERS,
MESSRS. HANKEY & CO.
HONORARY SECRETARIES,
A. J. SCRUTTON, Esq., 81, Old Broad Street;
THOMAS SCRUTTON, Jun., Esq., 3, Corbet Court, Gracechurch Street.
GOVERNOR,
Mr. J. W. GORDELIER, at the Institution.

Fifty youths are maintained at an annual average cost of about £1000.

Contributions are earnestly solicited, and will be gratefully acknowledged.

SAVINGS BANK DEPARTMENT.

SOUTHWARK, METROPOLITAN, and PROVINCIAL FREEHOLD LAND and HOUSE SOCIETY

Trustees,
Thomas Pillow, Esq., James Pollock, Esq., and W. H. German, Esq.

FIVE PER CENT. ON DEPOSITS. — Dividends payable on and after the 1st of January and the 1st of July.

Offices: 4, Wellington Chambers, London Bridge, Southwark.
RICHARD BRETT, *Secretary.*
Prospectuses forwarded on application.

ROYAL NORTHERN SEA-BATHING INFIRMARY: established in 1811.—A New Infirmary, long very much needed, is now in course of erection. £2,000 is required to complete it. This Charity is intended to provide a Home for patients, from all parts of the kingdom, requiring sea air. It is supported entirely by voluntary contributions, and these are earnestly solicited.

THOMAS HUTTON CROFT, *Hon. Sec.*

METROPOLITAN FREE HOSPITAL, Devonshire Square, Bishopsgate, City, N.E.

PATRON.
H. R. H. THE PRINCE CONSORT, K.G., &c.
VICE-PATRON.
THE RIGHT HON. THE LORD MAYOR.

This Institution is continually open to the Sick Poor of every nation, without requiring a letter of recommendation. It is entirely dependent upon voluntary contributions for its support, and is urgently in want of Funds.

BANKERS: Messrs. BARNETT, HOARE, and CO, Lombard Street, E.C.

GEORGE CROXTON, *Secretary.*

ONE SHILLING PER SHARE.

THE ART UNION of GREAT BRITAIN, under the sanction of Her Majesty's Most Honourable Privy Council.

First Prize, Painting, value £150
Second „ „ „ £100
with 98 other Picture Prizes, from £5 to £75 each.

Prizeholders have the privilege of selecting their own paintings from any Public Exhibition in Great Britain or Ireland.

In addition to the above Picture Prizes there will be about 500 other prizes, consisting of Engravings, Statuettes, Busts, Vases, &c., in Parian, Terra Cotta, and Bronze.

Tickets, price One Shilling, each ticket entitling the holder to one chance in the drawing, may be had from all the principal Printsellers, Music and Booksellers, and from the office of this paper; or they will be forwarded direct by the Secretary on receipt of an envelope (stamped and directed), together with postage-stamps or post-office order for the number of tickets required.

39, Princess-street, Manchester. SAMUEL H. DEAN, Secretary.

PHRENOLOGY APPLIED TO CHILDREN may lead to the avoidance of many of the errors so frequently committed in their education and subsequent destination. During Mr. DONOVAN'S long and extensive practice as a consulting phrenologist, his attention has been particularly directed to this most important branch of cerebral science. Consultations from 9 to 6 daily. Free Lectures on Monday evenings, as usual. 1, Adelaide Street, Trafalgar Square, W.C.

WHAT WILL THIS COST TO PRINT? is a thought often occurring to literary minds, public characters, and persons of benevolent intentions. An immediate answer to the inquiry may be obtained, on application to RICHARD BARRETT, 13, Mark Lane, London. R. B. is enabled to execute every description of PRINTING on very advantageous terms, his office being furnished with a large and choice assortment of Types, Steam Printing Machines, Hydraulic and other Presses, and every modern improvement in the Printing Art. A Specimen Book of Types, and information for authors, sent on application, by

RICHARD BARRETT, 13, MARK LANE, LONDON.

WHY GIVE MORE?—Excellent TEAS, Black, Green, and Mixed, are now on sale, for Family Use, at **2s. 8d.** per pound, at NEWSOM and Co.'s Original Tea Warehouse, 50, Borough. Near London Bridge Terminus. Established A.D. 1745.

ALARM GUN.—Capt. NORTON'S ALARM GUN, without vent or touch-hole, fired at the muzzle by friction, for protection against burglars, poachers, &c., is to be had of the London Gunmakers: Field, Blisset, and Beckwith, Holborn; Reily, New Oxford Street; Lang, Cockspur Street; Daw, Old Broad Street; and Wilkinson, Pall Mall.

A NEVER-FAILING RECEIPT for 30 Stamps, to make the HAIR GROW and CURL.

A very valuable RECEIPT for 30 Stamps, to make a FIRST-CLASS HAIR-DYE.

LADIES! If you wish your Skin to be Clear, Fair, and Blooming, send me 30 Stamps, and I will forward you the receipt. Its effect is surprising. It removes Tan, Freckles, Pimples, and other unsightly marks. It is perfectly harmless, and may be prepared by any lady at a trifling cost. These Receipts are superior to anything of the kind hitherto discovered.

MISS GEORGIANA COUVES, PIANISTE, (Organist at St. Saviour's Chelsea), late of Queen's College, where she obtained two First Class Certificates for Instrumental Music, Harmony and Composition, under the tuition of Dr. Sterndale Bennett. begs to announce that she will be happy to attend Private Families and Schools in any locality, within twelve miles of London, to give instruction on the Piano, Organ, and Composition. 35, Stanley-street, Ovington-square, Chelsea, S.W.

THE BOOK-HAWKING CIRCULAR. Pp. 20 (quarterly), price 1d.

The BOOK-HAWKER: his Work and his Day. Second Edition. By Rev. H. G. De Bunsen, M.A.

BOOK-HAWKING, in connection with EDUCATION. By Rev. Nicholas J. Ridley, M.A.

Published for the "Church of England Book-Hawking Union." Price 2d. each, or 7s. 6d. per 100.

AYLOTT & SON, 8, Paternoster-row.

SPECTACLES—MICROSCOPES—TELESCOPES.—FINE STEEL FRAMES, with REAL PEBBLES, 7s. 6d. and 10s. 6d.: ditto, best Glasses, 5s. 6d., 4s. 6d., 3s. 6d.; Solid Gold, 20s.; Silver, 10s. 6d.

BERNARD DAVIS, 430, Euston Road, Regent's Park (close to Trinity Church), Optician to the Ophthalmic Institutions. Country residents can be accurately suited by stating age, &c. Enclose stamps, or P. O. order, payable Upper Baker Street, London.

MICROSCOPES, magnifying from 5,000 to 15,000 times, mahogany cases, 21s., 17s. 6d, 12s. 6d. Ditto, with all necessaries for every purpose, in upright Mahogany Cabinet, magnifying 60,000 times, £4 4s., warranted.

POCKET TELESCOPES, define ten miles, 10s. 6d.; ditto, 20 miles, 21s.

SMALL POCKET TELESCOPES, of immense power, and to show Jupiter's Moons, &c., by night, 60s.

MAGIC LANTERNS and SLIDES complete, 6s. 6d. 9s. 6d., 11s. 6d., 18s. 6d., 21s., 30s., up to 90s. Catalogues free for one stamp.

ALLEN'S PATENT PORTMANTEAUS, AND TRAVELLING BAGS, WITH SQUARE OPENING; Ladies' Dress Trunks, Dressing Bags, with Silver Fittings; Despatch Boxes, Writing and Dressing Cases, and 500 other articles for Home or Continental Travelling. Illustrated in their new Catalogue for 1859. By post for two stamps.

J. W. ALLEN, Manufacturer of Officers' Barrack Furniture, and Military Outfitters (see separate catalogue), 18 and 22, Strand.

INSTITUTION for the EMPLOYMENT of NEEDLEWOMEN, 26, Lambs' Conduit-street, W.C.

PATRONS.

The LORD BISHOP of LONDON.
The LORD BISHOP of OXFORD.

PRESIDENT.

The EARL of SHAFTESBURY.

LADY PATRONESSES.

The Duchess of Beaufort.	Mrs. Tait.
The Lady Elizabeth St. Aubyn.	Mrs. Gurney.
The Lady Emily Stratford.	Mrs. Cave.
The Lady Radstock.	Mrs. Alers Hankey.
The Hon. Lady Mason.	Mrs. Head.
Hon. Mrs. Sydney Herbert.	Mrs. Gell.
Lady Troubridge.	Mrs. Bayley (Authoress of "Ragged Homes.")
Lady Lindesay Bethune.	Mrs. S. C. Hall.
Lady Havelock.	Mrs. Bracebridge.
Lady Hart.	

TREASURER.

Stephen Cave, Esq., M.P.

SECRETARY AND LADY SUPERINTENDENT.

Miss Ellen Barlee.

The Institution for the Employment of Needlewomen has been formed to assist workwomen of good character, by obtaining work for them, and securing to them the full average remuneration which they would receive were they able to take the work directly from the establishments for which it is executed, instead of obtaining it through the agency of a sub-contractor.

It is calculated that the lower classes of needlewomen in London exceed 30,000 in number. Of these a large proportion working from 10 to 18 hours per day, do not earn more than from 2s. to 6s. per week. Taking into account the slack season, illness, and inability to procure work, many can scarcely average half that sum. It may reasonably be expected that each worker employed by the Institution will be able to earn from 5s. to 9s. per week, an amount on which they can at least subsist, and which will save them from the terrible privations, and consequent temptations to dishonesty and vice, with which they have now to struggle.

To make an Institution of this kind permanent, and worthy of public support, it ought not to be a merely charitable effort, but must ultimately be supported to, at least a great degree, by those who benefit by it. The women employed, therefore, will be required to pay a small percentage on their earnings, (say a penny in each shilling,) towards the necessary expenses of rent and taxes, fuel, superintendence, etc. A contribution to this amount from 300 women, earning, on an average, 1s. per day, would fully meet all the ordinary charges of the Institution. But some time must elapse before the Society can secure employment for so many, and in the interval, the same machinery being required, its objects can only be attained by the help of those who feel an interest in the class which it desires to benefit.

For this aid the promoters of the Institution would confidently appeal. They believe the Institution eminently calculated to promote industry and good conduct in the women employed, and to permanently improve their religious and moral condition.

They would gratefully acknowledge the kind assistance which they have already received, and which has encouraged them to commence their undertaking by engaging the premises they now occupy at 26, Lambs' Conduit-street. Here Work-rooms have been prepared sufficient for the employment of about sixty workers, with a dormitory for the accommodation of a few of the most friendless and destitute—women with families being allowed to take the work to their homes. Further subscriptions are absolutely necessary to enable them to carry out their objects effectively; and especially to provide a Guarantee Fund, from which the parties who intrust work to the Society may receive security if desired, and may be indemnified for any incidental loss or damage. Such additional assistance the promoters of this Institution would earnestly solicit, as well as supplies of work, to allow of their giving the women constant and regular employment.

A single Institution of the kind now established, can only partially provide for the wants of so numerous a class, but should this effort succeed, and sufficient funds be obtained, it is intended to open Branch Institutions in other parts of London.

The Institution is open to the inspection of Visitors from 10 to 5, each week-day Mondays and Saturdays only excepted.

Post Office Orders addressed to the Secretary may be made payable at the Post Office, 62, High Holborn, W.C.

Donations will be thankfully received by Messrs. Prescott and Co., Bankers, Threadneedle-street.

Further details will be found in a little work, entitled "Our Homeless Poor, and What we can do to Help them." J. NISBET and Co., Berners-street, and of all Booksellers.

"Parcels of cast-off clothing will be thankfully received for the poor women, many of whom are most destitute.

IMPORTANT to every Man who keeps a Horse, Cow, Sheep, or Pig. The receipt to make the celebrated HORSE and CATTLE FOOD, for 13s. per cwt., the selling price being 42s. and 50s. per cwt.

N.B.—Two receipts sent for 44 Stamps; three for 60 Stamps; or the four for 78 Stamps.

Address, Mr. J. TAIT, Chemist, Newcastle-on-Tyne.

BROWN and POLSON'S PATENT CORN FLOUR,

Preferred to the best Arrowroot.

Delicious in Puddings, Custards, Blancmange, Cake, &c., and especially suited to the delicacy of Children and Invalids.

The *Lancet* states—"This is superior to anything of the kind known."

Trade Mark and Recipes on each Packet, 4 and 16 ozs.

Obtain it where inferior articles are not substituted, from family Grocers, Chemists, Confectioners, and Corn Dealers.

PAISLEY, DUBLIN,

77A, Market Street, Manchester, and 23, Ironmonger Lane, London.

PENCILS! PENCILS! PENCILS!

GOOD STATIONERY, at reasonable Prices,

At G. BLIGHT'S, 168, Fenchurch Street, London, E.C.

WHAT A NUISANCE!!!

There's the point gone again, just in that fine outline, too; AND THE GRIT!!! Oh, what *shall* I do?
I *must* try those Gilbert's Pencils that Blight sells.
Let me see, it's G. BLIGHT, General Stationer, 168, Fenchurch Street, London, E.C.

And he sends a set of six different shades, post free, for Eighteen Postage Stamps.

GLENFIELD PATENT STARCH,

Used in the Royal Laundry,

And pronounced by Her Majesty's Laundress to be the finest Starch she ever used.

WHEN YOU ASK FOR

GLENFIELD PATENT STARCH,

SEE THAT YOU GET IT,

As inferior kinds are often substituted.

Sold by all Chandlers, Grocers, &c. &c.

WOTHERSPOON and CO., Glasgow and London.

BROWN & POLSON'S

PATENT CORN FLOUR.

The *Lancet* states: "This is superior to anything of the kind known."

THE most wholesome part of the best Indian Corn, prepared by a process Patented for the Three Kingdoms and France, and wherever it becomes known obtains great favour for Puddings, Custards, Blancmange; all the uses of the finest arrow root, and especially suited to the delicacy of Children and Invalids.

BROWN & POLSON,

Manufacturers to Her Majesty the Queen: Paisley, Manchester, Dublin, and London.

PHOTOGRAPHY.—This beautiful and wonderful art has long been in the hands of mere charlatans and speculators, whose imperfect knowledge and unskilful manipulations have produced only vile caricatures of our friends. Mr. Barrable, 244, Regent-street, is the first, who, with the reputation of an artist, has applied himself to the study and practice of Photography. In his studio the most beautiful portraits are produced at half the usual prices charged at the West End for much inferior articles. Mr. Barrable respectfully invites the public to an inspection of his specimens.

HOLLOWAY'S OINTMENT AND PILLS.—DIARRHŒA, CHOLERA.—The victims of these two diseases are again enumerated in the weekly bills of mortality. With the hot damp weather, defective drainage, and impure exhalations, the number of deaths from these two diseases will steadily increase, unless some treatment be found capable of counteracting and overcoming them. When flatulence and indigestion first give warning of the coming evil, Holloway's Ointment should be assiduously rubbed over the abdomen, while his Pills are taken internally. These remedies act harmoniously together, and effectually arrest diarrhœa or cholera. Under the judicious use of Holloway's preparations the tongue becomes less furred, the failing appetite returns, and vigour is renewed. The nervous system is invigorated by them, and health renewed.

THE BISHOP OF LINCOLN ON NATIONAL EDUCATION.—In the course of an address at an entertainment given by the Mayor of Stamford (Mr. W. Langley), on the occasion of the opening of new schools in that town, on Tuesday, September 4th, the Bishop of Lincoln thus adverted to the subject of national education:—"At the present time," said his Lordship, "we have peculiar interest attaching to every school that promises to be a good school; for we should be blind to the signs of the times if we were to conceal from ourselves that in all probability within the next two or three years the question will have again to be raised and decided whether the general education of this country is to be an education grounded on and impregnated with specific religious teaching, or whether it is to be such an education as they now have in the United States, where religion is dissevered from education, and where it is left to be given, and therefore in the great majority of cases it is never given at all, out of school. There are many of our leading statesmen on both sides the House, many for whose conscientious opinions I have the highest possible respect—who believe, and are prepared to act on their belief, that nothing but a State education—either one centralised in the hands of the central government, or supported by rates in the various parishes—can reach the wants of the people, and they are looking with interest and hope to the forthcoming report of the Education Commission, expecting to obtain such facts as will give them great support in coming before the country again with some such scheme as we have seen during the last three years propounded in both Houses of Parliament. I have great respect for their motives, but for my own part, I must say, and I believe that most of those present entertain similar feelings, that I should consider it a very sad day for England when the system of education was so changed that it became from henceforth scarcely possible to give in our schools any definite religious instruction. Now, of course, the main argument upon which their efforts rest, and the only one which could ever enable them to carry the country with them, would be the failure of the present system, and whenever they can point to a large town, or to a flourishing parish, or even to a number of small parishes, where there are no good schools, and where people are growing up uneducated, they have an argument undoubtedly very difficult to answer. They would say,—'Your present system fails; we can no longer leave education to voluntary efforts, but must adopt another plan.' So that I conceive that every good school—every school built like the one opened to-day, which I know will be conducted on religious principles—cuts away that argument from under their feet; and I have little doubt myself that if the present system is allowed to remain undisturbed for some few years longer, there will be no reason to compare England unfavourably, on the score of education, with any nation on earth." (Applause.)

SOCIAL SCIENCE ASSOCIATION MEETING AT GLASGOW.

The fourth annual meeting of the Social Science Association was opened on Monday, Sept. 24, at Glasgow.

The inaugural address* was delivered by Lord Brougham, the President of the Council, at eight o'clock P.M., in the City Hall, which was entirely filled.

Lord Brougham, who, on presenting himself, was received with a welcome of the most enthusiastic kind, spoke as follows:—

"It is impossible to open the congress without expressing the satisfaction felt by all that this, our fourth meeting, should be held in the great capital of the West of Scotland, the centre of her manufactures, and the emporium of her trade. But we also are highly gratified at finding ourselves in a place not more renowned in the history of commerce than in that of philosophy, and of those branches of philosophy which have exercised the most important influence in the promotion of Social Science. It was here that Black made those discoveries which have changed the face of natural science more than any since the days of Newton; that Watt gave the great invention to the world which has made such an alteration in its aspect, and such a revolution in its fortunes; that Stewart learnt and Simpson taught the ancient geometry which he restored; that Reid placed the philosophy of mind upon its firm foundations, and freed it from sceptical cavils; that Millar traced the history of the constitution on principle, free from vulgar errors of empirics, as well as of absolutists; that Smith established those sound doctrines, now happily become the faith of practical statesmen as they had long been of the learned, connecting the commercial gains of all nations with the improvement of each, and making their mutual intercourse a mutual and equal benefit, and the bond of peace. Nor let it be forgotten that here the great step was made by Birkbeck (on which, five and thirty years ago I congratulated you) of throwing open to all classes the temple of science, and showing that the highest intellectual cultivation is perfectly compatible with the daily cares and toils of working men. These are proud recollections for Glasgow; and this pride is shared, not envied, by her sister, Edinburgh, whose own glories are far too bright to dread being outshone. The hospitable reception for which we are thankful here is given to the east as well as to the south; and though locally on the Clyde, the congress embraces the Forth and the Thames, and the Liffey. It is the congress of all Scotland, and of England and of Ireland, and is not even confined within the four seas that surround our insular empire.

"And here it would be wrong to omit the statement which I made at our first meeting in Birmingham, and many years ago in this place, that the greatest diffusion of knowledge is on no account to be dreaded even by those most subject to political alarms, because the more it is extended the more it humanises, preventing dangerous errors, inculcating mutual forbearance, imposing self-restraint, dispelling perilous delusions, securing in all respects the good order and peace of society. It acts like that happy invention which we owe to the genius of Watt—the happiest perhaps ever made by man—the governor by which the expansion of steam provides against the risks that it occasions, a security created by the cause of the danger, and therefore in exact proportion to the risk.

. . . . . .

"The promotion of education in all its branches, and especially the extending it to the humbler classes by such means as may secure good instruction at an easy cost, and without breaking in upon their independence, has been a favourite pursuit of those who most regard the interests of society. On some details there have arisen party differences; but no class of persons, either in Church or State, can be found at this day to deny the importance of generally diffused knowledge, or to promulgate opinions in favour of ignorance. The subject, however, gives rise to the most interesting inquiries upon the mode and manner of attaining what all have alike in view; and we need but to cast our eye over the names of those who both now and in former years have presided over this department in our association, to be satisfied how little it can be regarded as a party question in any of its various branches. One matter has never yet been sufficiently considered at any of our meetings—to what extent, if to any, the education of children should be compulsory. That ignorance is the cause of crimes, directly and indirectly, is not denied. Those crimes are punished by the magistrate. Then does he perform his duty, if he does nothing to remove the cause, and trusts to the indirect operation of penal enactments? In some countries. Protestant as well as Roman Catholic, he compels parents to make their children attend school. No doubt these are chiefly States under the discipline of a government more absolute than ours. But in some having a free form of government, regulations amounting, if not to compulsion, yet substantially leaving the parent no choice, are found to prove successful in enforcing education without encroaching upon liberty. It is much to be desired that this question should engage the best attention of the Education Department at the Congress, and that all information should be brought together which the attendance of foreign members may enable us to obtain.

"Another subject deserving of immediate and full consideration is the great defect existing all over the country in the providing and superintending of teachers for the middle classes, and the due encouragement and proper control of these teachers. The upper and the humbler classes enjoy this benefit—the former from the great schools and universities, the latter from the Privy Council grants—the requirement of qualification in teachers, and the superintendence of inspectors; but no attention whatever is given to the qualification of middle-class teachers, though under these the most important part of the community receives instruction. Petitions, complaining of this neglect, were presented to Parliament last year, signed by 40,000 persons, of which I presented 120 to the Lords. The answer given by the Government was that the Privy Council had not the means of extending the system to the middle-class teachers; and yet, upon the best calculation that could be made of these classes being little more than half-a-million, having 120,000 children of school-going age, only 1,200 schools would be added to those under the Council Department. The whole subject of the teachers' position and qualifications deserves to be thoroughly examined, and especially with the view of raising in public estimation that most important class. They form a fourth learned profession, not necessarily connected with the other three, not even with the clerical body; though of course more with them than with the others. Let us hope that this Congress will not pass away without the greatest attention being given to the communications from professors of the didactic art, and to that art itself, the science and practice of teaching—skill in which too frequent experience shows may be but little possessed by those whose knowledge is most profound.

"Perhaps there is no subject which more urgently calls for the attention of the same department than the limits that should be assigned to the kinds of instruction for different classes of the community. Some propositions on this head are of obvious importance and of manifest soundness, as the maxim judiciously and usefully enforced on a late occasion by Lord Derby, addressing the founders of a Ragged School, that the first object in such seminaries is the training to habits of industry, and teaching the kind of work required from persons in their station. This maxim by no means excludes the acquisition of other knowledge; it only gives the first place to that which is the most necessary, and allows other portions to come in their turn. Another proposition, if indeed it be not involved in the former, is, that there exists an absolute necessity for changing in important respects the method of educating female children, not only in the humbler, but the better part of the working classes. They must be taught things which are of

* To leave space for Lord Brougham's address (from which long passages are already omitted), the article on Social Science, which should have appeared in the October number of the PHILANTHROPIST, is withheld until November. The usual reports of meetings held during the month are postponed from the same cause.

Digitized by Google

use to them in after life—as much more as may be, but these things at any rate; and, in the first instance, governesses who can teach music, drawing, French, Italian, even lesser accomplishments, are plainly not wanted, for they will not stoop to teach sewing and washing. Herein lies the main difficulty; those who are fit to teach reading, writing, and cyphering, are unable or unwilling to teach the more humble but more needful things. This, as to teachers both of boys and of girls, is one of the most essential objects to which the department can direct its attention. A good system of rewards, the judicious application of prizes, the due encouragement to successful teachers of common things, and a steady determination in the patrons of such schools to enforce the most useful teaching in the first instance, allowing no substitute for it—may put an end to a state of things which has in some places produced the greatest difficulty of obtaining servants for families otherwise well provided, or wives for workmen comfortably circumstanced.

"There are two subjects of a more general description, one of which has often come under discussion, and is not unattended with difficulty; but the other is of great importance, and by no means of difficult consideration. A great error was at one time committed, at the establishment of schools upon the plan of Bell and Lancaster. The facilities afforded for teaching great numbers under a single master, gave rise to a prevailing impression that cheapness of instruction could best be secured by these means; and there was too great a disposition to make this the ruling principle. But experience has proved, what a little reflection might earlier have shown, the vast advantage of numerous teachers. In truth, this is essential, not only for securing thorough instruction, but for maintaining that discipline, that influence of moral authority, which is the most important benefit conferred by attendance upon a school. It is to be hoped that the whole of this subject will be fully considered by the department, and these facts, which are the results of men's actual experience, be gathered together, and the inferences to which that experience leads be distinctly pointed out.

"The other subject adverted to as attended with more difficulty, that of religious differences, we are at this Congress peculiarly able to have fully discussed; and with the benefit of this country's experience, where the difficulty has in a great measure been overcome, though it had a less formidable shape than in England, in consequence of the relations between the Church and the sects, and between different branches of the Church, turning rather upon political than religious dissensions. But the whole subject deserves an elaborate investigation, in order to ascertain in what manner the two objects can be best attained; instruction and religious independence—instruction which, to deserve the name, must include spiritual as well as secular learning, and absence of all interference with the religious freedom, either of the parents or their children. They who set the most value upon religion, who cling to their faith as their most precious comfort in this world, and their only hope hereafter; into whose whole sentiments, as well their feelings as their opinions, it enters perpetually with an influence all pervading and unceasing—they are those who will most revolt at all suspicion of its contamination by mixture of worldly considerations, will most vehemently resist its being subjected to any pressure, and shudder most at the thought of its being prostituted to secular gain.

"But though education and training, imparting sound knowledge, religious and moral, and exalting the character, as of rational beings, is the most important of all our duties towards the humbler class of our fellow-citizens, it is by no means to supersede the care of their temporal welfare, or be taken as a substitute for that other imperative duty. A wide field is thus opened to Social Science, and it is one which only in modern times has received any cultivation. Count Rumford was a great benefactor to the world in promoting the more important of its branches. His plans, for the most part well devised to increase the comforts of the poor, and carried into execution while he held high court and military employment in Bavaria, deserve the greatest of attention; and the study of his Essays, in which they are minutely detailed, is a duty incumbent upon all well-wishers to the prosperity and the peace and order of society. Especially to be considered are his proposals for improving the construction and arrangement of cottages, for the convenient application of heat to culinary and other purposes, for the preparation of cheap, wholesome, and nutritious food, for the saving of fuel and alimentary matter. Much may be done for the substantial bettering of th· poor man's condition, and the preservation .of his health, as well as the saving of his money and of his labour by attending to Count Rumford's suggestions, in almost every instance the result of his actual experience, and in some respects, as in regard to the communication of heat, the corollaries from certain truths which he ascertained by his experiments, although he erred in some points of the chemical theory which he sought to establish upon them. One inference of much importance which he drew from the improvements effected in the condition of the poor, including the vagrant class, is the salutary tendency of increased comforts to lessen the number of crimes, as well as to mitigate their character, both in the civil and military portions of the community. There can be no greater encouragement to our efforts in augmenting the comforts of the people, than the high and pure gratification derived from the conviction that increase of happiness is attended with increase of virtue, that the good bestowed makes men more worthy to receive and enjoy it.

"Nothing can be more gratifying in this, and in every other view, than the success of the great measure which the working classes themselves have lately adopted to provide for their comfort, to husband their resources, and to protect them from imposition by the formation of Co-operative Societies; and happily these have greatly multiplied, especially in the manufacturing districts of Lancashire and Yorkshire. Such societies are of two kinds. The one has for its immediate object to expend the income of each member to the best advantage for himself; the other to enable him to obtain the largest return for his capital and industry. Sixteen years ago, forty Rochdale artisans, desiring to establish a society of the first kind, amassed by a weekly subscription of threepence from each member, the sum of twenty-eight pounds, hired a room for a store, laid in a stock of necessaries, and began to trade; selling not only to members, but to all who would buy. The enterprise provoked laughter. A neighbouring shopkeeper boasted that he could carry away the whole stock in a wheelbarrow. Now, however, the single room is multiplied into many distinct shops, spread over the town, and the weekly vend of the society exceeds 2,700*l.* per week. Every member must be the owner of five shares of twenty shillings each, the permitted maximum being a hundred such shares. The capital is paid in by small weekly or quarterly instalments. All the transactions of the society, whether purchases or sales, are for ready money, the entire absence of credit being the corner stone of the institution. The customer, whether member or stranger, is charged at the same price as at the ordinary shops of the town; but at the end of each quarter a division of net profits is made, and he receives his quota according to the amount of his purchases. To arrive at the net profit, the following deductions are made from the gross returns—the cost price of the goods, the current expenses of the stores, including the wages of the manager and his assistants, rent, repairs, a proper allowance to a depreciation fund, and 5 per cent. for interest upon capital. The residue is the net profit, for which, however, before it is divided among the customers, two and a-half per cent. is deducted for the maintenance of a library and a news-room. The society is governed by a committee elected from the members, which meets weekly, when it gives patient attention to all complaints. If real cause of dissatisfaction exists it is removed; if the complainant is in error he is reasoned with, and so successful has been the course taken by the committees that, although arbitrators have been appointed from the first, pursuant to the Acts under which the association is registered, yet it has never been necessary, even in a single instance, to engage their services! The benefits derived by the individual in the expenditure of his income upon this plan are manifold. It is enough to enumerate a few. First, antagonism of interest between buyer and seller is annihilated. All motive, therefore, to adulteration, or in any way to lower quality for the sake of diminishing price, is absent. No extra price is put on the goods to pay the rent of shops in expensive situations, nor for the plate glass or other costly fittings, nor for the loss occasioned by the expense of articles in the windows to attract customers, nor for advertisements; indeed, show is altogether discarded, and while no cost is spared to insure high quality in the articles themselves, no money is wasted on the means of attraction. The exact price of the article, too, is not very material. If the price is

Digitized by Google

high, the customer's returning profit is also high, and *vice versa*. But not only economy is consulted; the improvement of the character and habits is incalculably promoted. The workman is stimulated to the exercise of self-control, beyond his reach in ordinary circumstances. He must refrain from anticipating his income by running in debt in order that he may be able to pay ready money, and also to acquire capital; and to the self-denial essential to compassing these objects he is urged when he has their advantages clearly and forcibly set forth by his brother members, and, more than all, by the example of the body of which he forms one. Finding, then, strict economy a necessary condition to his maintaining the rank to which he has aspired, he casts about that he may so exercise his thrift, and abridge his expenditure, only in what is not essential to health and comfort; and soon discovers that abstinence from drink and tobacco not only subtracts nothing from his wellbeing, but greatly adds to it. But a working man out of debt, acquiring capital, however slowly, and abstaining from stimulants, is on the road to happiness, and with a prospect of attaining it as bright as is vouchsafed to any citizen of the State, even the highest in the land.

"The second class of these institutions—namely, those which have for their object to enable each member to augment his income, are at present but few in number, and their experience has been short. At Rochdale a society was founded four or five years ago for spinning cotton yarn and weaving it into calico. The principal distinction as regards financial arrangements between the two classes is that the net profits are divided among the artisans instead of the customers, each in proportion to his or her wages, the wages being fixed according to the rate of payment in the mills of the district. The disastrous years of 1857 and 1858 sorely tried this infant establishment, but it weathered the storm successfully; and although during a period of fifteen weeks no sales were effected, or sales only to a trifling amount, yet the hands were never put upon short hours, although the other mills of the town yielded in this respect to the pressure of the times. It is, however, far too early to predict success for co-operative societies of this class with any degree of confidence, or to speak of them otherwise than as hopeful. It appears manifest, and the observation is important, that co-operation is not only distinct from communism or socialism, but repugnant to it, far more so than to the ordinary course of trade, with which, indeed, it agrees in giving to every man the benefit of his own industry, skill, and economy. Co-operation leaves its votary in freedom, whereas communism, which makes him receive according to his wants, instead of according to his merits, extinguishes the ordinary motives to exertion, and failing, as it always has failed, to induce men to work from higher motives, must, if it continue in action, fall back upon coercion. Communism is, in truth, slavery in disguise; but as the slaves are also their own masters, they quickly emancipate themselves, and that being done the communities of socialists come to an end. Such is the appointed lot and fate of the kindred associations arising from strikes, even where these are carried on without breach of the law—that is, without in any manner exercising compulsion, directly or incirectly, to obtain the increase of members.

"This most interesting subject will certainly occupy both our general and judicial departments.

"At our last Congress great attention was given to the important subject of temperance, and especially to the necessity of preparing public opinion for those repressive measures, which experience daily proves more and more clearly to be required for lessening the consumption of spirituous liquors. The great source of pauperism and of crimes has hitherto only been attacked by palliatives, and although these have had a certain success, yet if there be any means not exposed to serious objections by which the evil may be extirpated, the gain to society would be incalculable. No measure of absolute repression can, of course, be recommended until the public mind has been not only prepared, but strongly inclined for it. But the proposal of the grand alliance well deserves a careful consideration—the plan of enabling a certain proportion of the inhabitants in every district—a proportion considerably above the commercial majority—to give the magistrates authority for placing the district under a general Repressive Act, passed with such modifications as, according to the Act's provisions, may be allowed in the peculiar local circumstances. A very extensive adhesion has been given to the proposal in the great districts of Manchester and Birmingham, and this, besides its intrinsic merits, will be quite sufficient to cause a searching examination by our departments, sanatory and of jurisprudence. That it deeply concerns both need not be added. But, which of all our departments does it not most deeply concern? Remember the memorable expression of that great philanthropist, our eminent colleague, the Recorder of Birmingham—'Whatever step I take,' says Mr. Hill, 'and into whatever direction I may strike, the drink demon starts up before me, and blocks the way.'

"This is a subject which, happily, with us has never, in any respect, been brought within the dominion of party, either civil or religious. Such, however, has not been its lot in the new world; and it affords the most remarkable illustration of the evils which afflict the United States from the practice of their constitution, maintaining in every part of the country an incessant canvass, caused by the distribution of patronage and change of offices. Every subject of a nature to interest the community, and thus to create a difference of opinion, becomes the ground of controversy to contending parties, and so the Maine Liquor Law became a question upon which governors were chosen and removed. The evils which the suspension of that law occasioned, in the great increase of pauperism and crimes which had under its beneficent operation, been reduced within an incredibly narrow compass, but which now rapidly revived, so seriously impressed men's minds with the mischief of having made it a party question that a resolution was passed at the State Convention against ever so treating the subject hereafter; the repeal of the suspension law was effected, and all attempts against the Maine Law were afterwards defeated by reference to the resolution of the Convention. Nothing can redound more to the honour of the American people than their thus firmly persevering in their just and righteous determination. But it is impossible to avoid feeling how great is our happiness in this country to be free from the influence of such disturbing forces upon our most important measures. We discuss them freely on their own merits, and apply to the consideration of them those principles which, on mere matters of science, but science reduced to practice, should guide the inquiry and dictate the conclusion. We are removed above the storms raised by popular fury, nor are ever stunned by the noise which the Psalmist compares to that of the raging sea; and our vision is not obscured by the clouds which faction drives together.

"Thus gradual and slow has been the course by which we have arrived at Social Science, unconnected with faction and class interest. First there was the reign of party and personal views, without even the pretence of any principles or opinions; next came the time when opinions were professed, but in subordination to party and personal views; then arose the day of opinions, to which these views were subservient; at length came the age of principles and opinions, wholly apart from party schemes and personal interest. The progress has been gradual but sure; and Social has run the course of all other science, in being the growth of ages, and making its advances safely by slow degrees.

. . . . . .

"At our first meeting, in 1857, the subject of judicial statistics was brought under consideration in the able and useful papers read by Mr. L. Levi; and in consequence of the discussion which took place, very considerable improvements were introduced into that department of the Treasury, so that at our last Congress hopes were entertained of such complete and regular information being afforded as the annual report of the Minister of Justice presents in France. A most important step has since been made in that direction. The meeting of the International Statistical Congress has been held, under the presidency of the Prince Consort, whose opening address—marked by the sound sense, the accurate information, and the general ability which distinguish all his Royal Highness's exertions—is in the hands of all our members. Having been requested to superintend the judicial department, and having afterwards, in his Royal Highness's absence, presided at the general meeting, it was a great satisfaction to find the unanimous adoption of the plan which it became my duty to report, embodying the resolutions in full detail upon the whole subject; and there was a strong recommendation unanimously passed, urging the Government to appoint a permanent statistical commission. The report has been presented to the House of Lords (where,

Digitized by Google

indeed, I had several years before brought forward the resolutions which formed its groundwork this year), and it is now among the printed papers of the session. There were naturally present at this International Congress eminent men from various parts of the Continent; and in announcing the assembly of the present meeting, I took the liberty of inviting those distinguished foreigners with whose presence, I trust, we are now honoured. Among others was a negro gentleman of great respectability and talents, Dr. Delaney, who had attended different departments, and, in his able address, had communicated useful information and suggestions. When inviting him to this Congress, I informed him that he would have the satisfaction of visiting the country which first declared a slave free, the instant he touches British ground. Dr. D.'s forefathers were African slaves; he is himself a native of Canada. It is truly painful to reflect that, although his family have been free for generations, his origin being traced to one whom the crimes of white men and Christians had enslaved, he would be in the land of transatlantic liberty, incapable of enjoying any civil rights whatever, and would be treated in all respects as an alien; the iniquity of the fathers being inexorably visited, not upon their children, but upon the children of their victims to all generations—children whose only offence is the lot of their parents, whose wrongs they inherit with their hue.

"Connected with statistics is a subject which occupied our Sanitary Department last year, the defects in our public records of sickness and mortality, and the valuable papers of Mr. Rumsey gave rise to much discussion. The Council appointed a committee to investigate the question, and resolutions were agreed to, on which a communication was opened with the Government. There can be no doubt that the present system will receive extension and improvement. Unfortunately, as much cannot be said respecting the report of another committee named by the Council on the defects of the census, 1851, and their valuable suggestions for its improvement in 1861. These were kindly received by the Government, and attention to them was promised; but the Act, as passed, does not provide for any material improvement. On one matter there really can be no doubt; the returns for the three kingdoms ought on every account to be made uniform. It is to be hoped that the success of the National Congress may lead to a still more important international assemblage on the assimilation of commercial law. On this great subject Mr. L. Levi's lectures delivered both here and in Edinburgh, as well as in London and Birmingham, contain the most valuable information and suggestions. It has been deemed advisable to take so large and difficult a subject piecemeal; a beginning is made with statistics, and the Council, as will afterwards be stated, has broached that of uniform general averages.

The subject hardly to be surpassed in importance, the employment of educated women, was discussed at the last Congress, and a society was soon after formed for promoting it. Last Easter it became connected with this association; and the laudable exertions of Miss Bessie Praks, whose interesting paper had mainly led to its formation, and of Miss Faithful, and other fellow-labourers in this good work, have already been attended with marked success. Several papers upon various views of the subject will be read at this meeting. It may now only further be stated that the meeting held in last June, presided over by Lord Shaftesbury, was very numerously attended. The great object of finding employment suitable to educated women was fully considered; and our secretary, Mr. Hastings, took a prominent and useful part in the discussion. Among other occupations, law-engrossing, book-keeping, and printing may be mentioned as well fitted for educated females. The printing press, conducted under Miss Faithful's superintendence, has been eminently successful, and since the meeting in June, has received the highest sanction of the Queen's approval, signified in a gracious letter by her Majesty's commands. It is very gratifying to find that the experience of this press has removed most, if not all, the objections which were at first raised against the plan. It is fit to add that the energy, perseverance, and discretion of Miss Faithful have mainly contributed to this happy result.

"The subject of trades' societies and strikes engaged much attention at the last meeting on the discussion of the preliminary report of a special committee appointed by the Council, and of very able and interesting papers presented by Messrs. Watts, Plummer, Ross, and others. The committee has now concluded its labours, and the final report, with a large volume of papers, contributed by different members, has been printed, and will be published here. A very interesting discussion may be expected upon the whole subject; and this country is peculiarly suited to the calm and dispassionate consideration of it, because happily little of the mischief which has befallen England, from the differences between workmen and masters, have afflicted Scotland.

"A paper on Patent Law was read at Bradford by Mr. Thomas Webster, and a long discussion took place; at the conclusion, ex-Chancellor Napier suggested that a committee should be appointed to co-operate with the similar committee of the British Association. This was done by the Council, a joint committee was ultimately formed, which will report at this Congress.

"On the representation of the Underwriters' Association at Liverpool, the Council determined to issue a circular inviting delegates from the Chambers of Commerce and other bodies in all countries to discuss the possibility of making a uniform general average for all the world. This circular, signed by the chairman of Lloyd's, and other bodies of influence, as well as by the President of our Council and General Secretary, has been fully responded to, both in America and on the Continent, and an important and useful discussion may be expected at this meeting. It is hoped that resolutions may be passed which will form the foundation of a code of general average. In order to facilitate this, the Council have had prepared a synopsis of laws and customs of various countries on the subject. This will be circulated previous to the debate.

"The Committee on Quarantine have continued those inquiries which were referred to last year, and have received a large number of replies, some of a very valuable nature, from various governors of colonies, consuls, and other functionaries throughout the world. They have again to acknowledge the courtesy of the foreign and colonial ministers in facilitating their inquiries. So valuable has been the information obtained that, on the motion of the Board of Trade, the House of Commons has ordered the replies sent to the committee to be printed for the use of the House. A printed paper, from Constantinople, shows the interest felt in the Levant on this subject. A report will be presented by the Committee to the Association at this Congress.

"The Council are glad to say that Mr. Scholefield has succeeded in passing his Bill for repressing the adulteration of food, which it is hoped may be found useful, though not in its details entirely satisfactory. We cannot dismiss the important subject of sanitary policy without expressing the satisfaction felt at the appointment of the Indian Army Sanitary Commission, which may justly be ascribed to the able paper of Mr. Chadwick discussed at the Liverpool meeting.

It is, unfortunately, impossible to express the same satisfaction with the conduct of the Government upon another yet more important question—the education of the humbler classes of the people. The subject was brought before Parliament by our colleague, Sir J. Pakington, in an admirable speech, urging the claims of Ragged Schools to a share of the Privy Council grant. The refusal to assist in preventing pauperism and crime by diligently educating and training the class of children from whom vagrants and criminals are bred, is perhaps one of the greatest economical, let us rather say social, mistakes ever committed. It is an abdication of the most imperative duties of a State, that of helping those who cannot help themselves, as well as the self-destructive impolicy of withholding a little outlay in schooling from those on whom they must afterwards spend largely in the way of jails and workhouses. We shall, no doubt, have Miss Carpenter's protest added to ours in this momentous question.

"The whole reformatory measures are intimately connected with this subject, and the success of these with juvenile offenders is now clearly proved in the diminution of their crimes. The diminution of other offences, it is to be hoped, has taken place likewise; but a disturbing influence of a kind deeply to be lamented has operated from the impolitic restricting of the remuneration of witnesses. The case of juvenile offences affords the strongest reason for extending to adults the reformatory system so ably and satisfactorily explained by Captain Crofton, to whom we owe it, at our Liverpool meeting. Its success in Ireland has been complete.

"It is to be hoped that within either the

Digitized by Google

sanitary or the general department the subject may be allowed to fall, of the great frequency of fatal accidents lately to be deplored. Those on railways really urgently demand attention, and their causes cannot be fully investigated without the suggestion of some preventive. It is remarkable that the evil is confined to Great Britain. In France the greater discipline and more careful administration, even more than the lesser speed and the want of excursion trains, is probably the reason that grave accidents there are all but unknown. The other class of injury to persons, often fatal, is that of careless or foolhardy and adventurous travellers being severely hurt, often losing their lives, in attempts to climb or descend dangerous passes, in neglect or in defiance to their guide's advice. The misery thus inflicted on families—in some case the public injury thus occasioned—should be impressed upon men's minds, and the guilt incurred by their carelessness or obstinacy. A life thus thrown away is by self-slaughter, not self-murder; and the crime bears the same relation to suicide that manslaughter does to murder.

"It may be recollected that at Bradford a very important discussion arose in a branch meeting, over which I had the honour to preside, upon the question of direct or indirect taxation, and I presented a report describing the diversity of opinion which prevailed on the general subject, but stating the conclusion at which we had, with great unanimity, arrived in favour of repealing the numerous duties so oppressive to trade and so unproductive of revenue. In consequence of the Bradford discussion, a special committee was appointed by the Council, and will report at this Congress; but its report will be confined to a statement of the conflicting opinions held embodied in two short papers—one by Mr. Newmarch, the well-known statist, the other by our secretary, Mr. Hastings. The committee expressly declined propounding any opinion of their own, thinking that the question requires more careful investigation and more dispassionate discussion than it has hitherto received. Our Association, standing aloof from political parties and class interests, and viewing the subject as a problem of science to be solved without prejudice or passion, is the fittest place for such a discussion.

"On the 22nd of November last, the Mercantile Legislation Committee of the Association, originally appointed at the Liverpool meeting, sent a deputation to Lord Palmerston to represent the necessity of an Act to improve the law of bankruptcy. The deputation was attended by delegates from all the Chambers of Commerce and Trade Protection societies in England, by London merchants, and by numerous members of Parliament. Lord Palmerston (with whom was the Attorney-General) promised that a bill should be introduced—a promise which was fulfilled—but in more than one respect the Government measure differed from that recommended by the committee, especially in the restricted jurisdiction which it gave to the County Courts. Nevertheless, the committee gave a general support to the Bill, and would have been glad to see it pass (with the requisite amendments) into law. The causes of its failure have been already adverted to; and it is hoped that next session a better course may be taken, and lead to a better result. A full report will be presented to the proper departments at this Congress, and valuable suggestions may be expected to arise out of its discussion.

"It is fit that we now advert to a very important step which has been taken for extending the operations of our national and central body by forming branch and local associations in connection, and, as it were, affiliation with us. There could be no doubt that Edinburgh was the proper place to commence this operation. On the 28th of March a large public meeting was held there, under the presidency of the Lord Provost. It was attended by many Professors of the University, and many other persons of eminence and weight. A branch association for Edinburgh was formed in close connection with the parent body. It already numbers many members, whose attendance at this Congress may be expected. An association of a more independent description has also been formed at Aberdeen, which will no doubt in some way affiliate itself with us. At Liverpool they are minded to convert the local standing committee appointed by the Association at its meeting in 1858 into a regular branch; and we may hope to see a similar result in this city, which may be termed, not the Liverpool of Scotland, but the Manchester and Liverpool combined. An application has also been made from Constantinople to appoint a local standing committee there, composed of gentlemen who have already acted as a sub-committee of our public health department on the subject of quarantine. The Council appointed a special committee to consider these various applications, and their report will be presented here.

"Social science is not confined to our country, and it is a duty, as well as a gratification, to observe its progress in other nations. Unhappily, the number is small of European States in which a popular Government affords the security of measures being proposed by the rulers calculated to benefit the people as well as themselves. But the diffusion of knowledge has made so manifest the tendency of an enlightened policy to promote the interests of the community, and thus in the result to serve the Government also, that the attention of absolute sovereigns has been drawn, if not driven, to such courses as must increase the wealth of their subjects, and consequently their own resources, and might, also, promote the comforts of the people, for which they probably cared little, unless as tending to preserve order and quiet without the control of force. Such sovereigns, too, have facilities for making and moulding laws, and effecting changes in the institutions, as well as the policy of the State—facilities which made the French sect, the Economists, prefer what they termed a legal despotism to a popular form of Government, and made even Bentham regard such a system with envy, when pressed by the difficulty of carrying forward his plans for the improvement of our jurisprudence. It is unnecessary to dwell on the grossness of the delusion arising from such one-sided views of the subject; but we may admit that some compensation is thus afforded by despotism for its great and various evils.

"The Russian Government is in form the most absolute of any in Europe, and nearly on a level with the Turkish, though it would be difficult to point out any difference in substance between that and the system of Austria and France, except that there the subject enjoys the inestimable advantage of a pure administration of justice, which also, in ordinary cases, imposes some restrictions upon the arbitrary power of the sovereign, though very little in those of a political description. But in Russia, greatly to the honour of the present Emperor, a resolution has been taken to effect the entire emancipation of the serfs, which had been only partially attempted by his two predecessors. The difficulties imposed, not only by the prejudices of the landowners, but by the other parts of the Government, are very formidable, and most persons acquainted with Russian affairs are impressed with the belief that material changes must precede this just and politic measure, and that even if the imperial plan were capable of being carried into execution, the serf freedom could not be permanently established without serious changes in the whole political state of the country. It is, however, a most fortunate thing that the attention of the Government, and of statesmen, should be fixed upon so important a measure as one having for its object the raising from servitude to liberty above forty millions, the bulk of the labouring classes.

"In Austria, beside material improvements of an economical and financial description, important reforms of a political kind are in course of being effected. The constitution and powers of the Reichsrath, or general council, have been extended, and there is a fixed determination to give each province of the empire a discretion in the management of its affairs, and more especially that Hungary shall either in form or in substance have its ancient constitution restored. The selfish spirit of the Hungarians, their refusal of rights to be shared by the other States, their demand of what may be regarded as privileges to distinguish them from the rest, has been a serious obstacle to the execution of the liberal designs in contemplation. It may safely be predicted that no improvements will be made so valuable as those introduced by Prince Metternich, one of the greatest practical reformers of his time, and by which he both controlled the power of the nobles, and raised the inferior classes to independence and comfort.

"The Prussian States, and those of the lesser German potentates, have been making steady, if not rapid, progress in their internal improvements; but their most important proceeding has been the fixed determination to stand together against any inroad whatever that may be attempted upon their independence. Their agreement with Austria is a step in the same direction; and in Belgium, which enjoys all the advantages of a free constitution, administered with singular wisdom and justice by the present Sovereign, the strongest indications have been given of

Digitized by Google

an adhesion to the principle so wisely laid down by the German States—indications which, both in their purport and in the manner of declaring them, must exclude all hopes that may have been entertained in any quarter of a disposition favourable to aggressive or intriguing designs.

"But the absolute government established among our nearest neighbours has made very considerable advances in those branches of its policy which are immediately connected with the well-being of the people. Œconomical measures, which tend directly to better their condition and to promote their friendly intercourse with other countries, have been patronised and actually adopted. It redounds exceedingly to the credit of the French rulers (possibly the word should be used in the singular number) that this wise course has been steadily pursued, in defiance of the openly-expressed discontent excited by the prejudices of the country, and the influence of certain powerful classes interested, or supposing themselves interested, against those wise measures, according to the remark, not more witty than just, of our own finance minister, "that men are always for free trade with an exception." When the constitutional government of France was forcibly supplanted by an absolute monarchy, Lord Denman expressed his hope that, at least, the people would receive some measures of law amendment which might not indeed sweeten, but soften the bitterness of the chalice commended to their lips. That ingredient has not been poured into the cup, but another emolient not less potent has been infused.

"The princes whose measures, equally just and wise, beneficial to their subjects and themselves, almost in the same degree, are either—as in Belgium, Prussia, and Sardinia—rulers according to law, or as those in Russia and France, who are a law unto themselves, and govern according to their good pleasure. But it is a great abuse of language to call them tyrants, and a confusion in ideas to treat them as such. The abuse of despotism is tyranny; the despot who, as such, is barely to be endured, by the abuse becomes a tyrant, who cannot be too much abhorred. He has inherent in him, by the necessities of his condition, some of the worst vices and most pitiable infirmities of our fallen nature; and he may have all—falsehood, concentration of all his feelings upon himself, disregard of all other men's, caprice unbounded and ungovernable, the habitual belief that his fellow-creatures are of a different species, and so to be treated, unless when recognised as human in order to degrade, pollute, and torment them the more—these are his appointed vices; but to them he may add the most savage cruelty, and delight in the sufferings he inflicts, without any other gratification to himself. If by some accident, some freak of fortune, he should have received any endowment of genius, or of person, it only makes him more hateful, like the wit of Tiberius, the beauty of Nero; as poets have feigned a fair basilisk, to make the monster more hideous. Men's only comfort is, that he must ever be a prey to the fears he spreads all around him, avenging others by the terrors he makes for himself. *Qui terret, plus ipse timet; sors ista tyrannis convenit.* When accompanied, tormented by suspicion and distrust of all; when alone, dismayed by the silence of the solitude he has created. Such a spectacle has actually been witnessed recently in the bloodthirsty and pitiful, though unpitying creature, composed of cruelty, falsehood, and cowardice, who, after the massacre of his unoffending subjects, durst not face either the vengeance of the survivors or abide the coming of their deliverer; but, at the distant sound of his approach, fled from the throne he had polluted and disgraced, with the booty his pillage had amassed. Young in years to have perpetrated such crimes! But Caligula died at eight-and-twenty, and Heliogabalus at eighteen.

"The difference between a despot and a tyrant may be wide, and the descent from the one position to the other steep, but unhappily it is easy. His lot who wields power uncontrolled and irresponsible, has this misfortune, that the abuse of it is natural, easy, and usual—the blameless use of it difficult and rare. As long as men are men, tyranny will be the natural end of despotism. But the more easy and natural the descent, the greater is the merit of those who nobly resist the temptations that strew their path, and doing a violence to their nature, holding fast by their integrity, will not slide down; but devoting themselves to their duty, promote the welfare of those under their sway, spurn all grovelling and vulgar fame, seeking the true glory of their people and their own; the guardians of peace, pillars of justice, patrons of benevolence, they take their place among the Nervas and the Antonnines, the most illustrious of mankind.

"Mightily must the cultivators of social science rejoice in such noble conduct of the absolute sovereigns to whom the fortunes of so vast a portion of the world are entrusted, and full well they know that their cause mainly rests upon the preservation of peace abroad and the maintenance of order at home. Well may they apply to social science the Roman orator's words, spoken of his own art,—"*Pacis comes, otiique socia, et jam bene constitutæ reipublicæ, alumni.*" Truly she is the offspring of peace, and by a greater than the Roman charity, gratefully gives her pious support to her parent. Let us not fear danger to this first of blessings from any quarter, by the pursuit of warlike glory, guilty, and as senseless as guilty, among any of our neighbours. An eminent political economist at our last Congress, declared that he only dreaded the arts of the fiend, enemy of mankind, tempting his countrymen with a laurel, instead of the apple with which he deceived our first parents. But it is edifying to observe the same individual now announcing his entire confidence in the pacific tendency of that enlightened policy to which he has himself so greatly contributed. In his hopes we must altogether share; in the greater part of his confidence also. But it is no mark of mistrust in others that we trust ourselves more; and we must all heartily rejoice in the spirit of determination to be well prepared, which the country universally shows. Let us also rejoice in the training to which it has given rise. As a mere sanitary measury this association has a right to view it and highly to estimate its value. But on far more lofty grounds we are bound to exult in it, for it is the pledge of peace. Here, above all other places, such feelings are natural and appropriate. We are in the land sanctified by the struggles of Religion, and renowned for supporting her sister, Freedom, in the worst of times. Here the martyrs of the cause swore to the covenant "by the name of the Lord their God"—here, in the next age, the rebels against civil and religious liberty encountered the stoutest resistance—here, in yet later times, was begun the arming of the people for defence of the realm. It is wonderful that attachment to religious and attachment to civil rights should kindle the same fire of prtriotism, and in the same bosoms! Those treasures which men prize the most dearly are nearest their hearts, and them with heart and hand they will defend."

The papers read before the meeting on the four succeeding days are given here collectively under their five respective departments, but were not so delivered, some papers from every division having been brought before the meeting on each day in their order.

First Department:
JURISPRUDENCE, &c.

J. Whitwell—Local Jurisdiction in cases of application for Private Acts for Public Purposes.

J. Pitt Taylor—On the expediency of passing an Act to permit Defendants in Criminal Courts, and their Wives and Husbands, to Testify on Oath.

J. Campbell Smith—On Reform in procedure in Criminal Courts.

Dr. Craig—Suggestions regarding Medical Evidence in Criminal Cases.

G. W. Hastings—Report from the Mercantile Legislation Committee on Bankruptcy.

Sheriff Glassford Bell—On Bankrupt Law.

G. A. Esson, Accountant in Bankruptcy for Scotland—Expenses in Bankruptcy, and the best means of lessening them, consistent with security.

W. J. Lamport—On the rights of Belligerents as to Maritime Property during War.

J. Andrews, Q.C.—On the Appellate Jurisdiction of the House of Lords.

Sheriff Barclay—On the Local Courts of England and Scotland.

W. T. S. Daniel, Q.C.—On the Division of Courts into Law and Equity.

John Smale—On International Law.

Professor More—On the System of Scottish Land Rights.

Professor Montgomery Bell—General View of the System of Registration of Land Rights in Scotland, with some relative suggestions.

Professor More—On Succession in Personal Estate, as affected by the Domicile of the Deceased Owner.

Leone Levi—Judicial Statistics.

SECOND DEPARTMENT: EDUCATION.

Miscellaneous.—Elementary Education.

Ed. D. J. Wilks—Fallacies and Facts in relation to Public Elementary Education.

Mary Carpenter—On the Principles of Education.

David Stow—Moral Training in connection with the ordinary Elementary School as a power to raise the sunken classes.

Rev. Dr. R. J. Bryce—Fallacy of the popularly received dictum, that "Endowments for Education are necessary."

Professor Pillans—Hints for improving the Elementary Stages of the Higher Education.

Leone Levi—On the Educational Bearing of the Decimal System.

Rev. Neil Livingston—The Present State of Musical Education in Elementary Schools.

Rev. Dr. J. B. Johnstone—Vocal Music, as a branch of Common School Education.

Dr. D. Brodie—On the Educability of the Imbecile.

Rev. W. Leggatt—Account of the Buchanan Institution, Glasgow.

Elementary Education of the Lower Classes —Educational Tests for Employment.

J. Gordon—On the State of Education among the Mining Population of Lanarkshire.

A. C. Weir—On the Inexpediency of Compelling Employers to Educate their Work-children. The failure of the attempt that has been made in Print-works, and the Educational Destitution of Britain, notwithstanding all that has been done.

George Anderson—On the means of extending Working-class Education.

Rev. J. P. Norris—The Education Bill of the last Session.

Miss L. C. Hope—On Popular Schools for Girls. The same subject, with special reference to Scotland.

James M'Clelland, F.E.S.L.—National Elementary Education in the United States of America, Denominational Grants and National Education.

Dr. James Bryce—The Minutes of Council viewed in connection with Scottish Conditions.

Principal Tulloch—The Parish Schools in relation to plans of National Education for Scotland, to the Universities, and the Church.

Rev. W. Fraser—Suggestions as to a Legislative Basis for a National System suited to the Educational Condition of Scotland.

J. C. Colquhoun—On the Advantages which accrue to Elementary Education from the System of the Committee of Council on Education.

Lower Class—Adult Education.

W. Keddie—On Adult Education and Bible Classes.

J. A. Hutchison—The Connection of Art with Education.

Professor H. Hennesey—On the Application of the principles of Free Trade to the Diffusion and Advancement of Knowledge.

Upper and Middle Class Education.

Henry Fawcett—On the Disadvantages of Restricting the Fellowships of the English Universities to the Members of the Church of England.

Dr. W. G. Blackle—Competitive Examinations for the Public Services, and the Preparatory Training in our Scottish Universities.

James Dale—Modern Competitive Examination.

THIRD DEPARTMENT.

PUNISHMENT AND REFORMATION.

Crime and its Incentives.

John Strange, LL.D.—Ten Years' Chronicle of the Prison of Glasgow; founded on the Statistical Tables prepared by the Governor, Mr. Stirling.

James Smart—State of Crime in the City of Glasgow, &c.

Sheriff Watson—The Crime of Aberdeenshire.

J. H. Burton—The tendency of Prison Statistics in Scotland for the last Ten years.

STATE OF PAUPERISM.—Again the monthly return of pauperism in England is satisfactory. Excluding a few parishes (286) under Gilbert's Act, or the old Poor-Law, and consequently making no return to the modern Board, the number of paupers at the end of July last was 768,943, the number a year previously having been 785,184. There is a decrease in every district except the South Midland, the Eastern, and the Welsh, which, as before, fail to render so good an account as the rest of the kingdom. Yorkshire shows a considerable decrease from last year; but the most remarkable continues to be that in the North-Western division (Lancashire and Cheshire); the decrease there is not far from 8 per cent.—*Times*, Sept. 11.

Notices to Correspondents.

The Editor requests that any circumstances connected with Charitable Institutions, which it may be thought advisable to bring before the public, may be communicated to him at 337, Strand, on or before the 14th of each month.

NOTICE.

CLERICAL DESTITUTION.

WE do not, in England, seek to remedy a social evil by a radical innovation. If any class of the community is discovered to be unfairly dealt with in the general distribution of good things, a check, or a series of checks, are applied from without, until the pressure is relieved. Thus "the sound part helps the unsound," while the general form of the social system is preserved. The mere fact of the occurrence of a large and increasing number of cases of poverty and destitution among the clergy of the Church of England will not lead to a redistribution of Church property. Analogies have been drawn between the stipends received by the civil servants of the State and the incomes of curates and the poorer incumbents. But there is not the least likelihood that the Church property will be resumed, or assumed, by the State, and the clergy paid out of the consolidated fund. As little probability is there that we shall have in England an

Digitized by Google

imitation of the church system of Sweden. The Ecclesiastical Commission will do right in maintaining its present system of demanding "equivalents," in spite of the remonstrances of mistaken friends of the clergy; for the simple fact is, that if the whole of the "Common Fund" were absorbed in the endowment of poor livings in the English Church, it would not be half sufficient for the purpose; whereas, while it is used to supplement the funds raised by other means, it does important service. In fact, the Ecclesiastical Commissioners virtually assert the principle which we recommend for the adoption of the clergy, that of "self-help." The clergy have not as yet done anything for themselves; it is therefore in vain for them to expect the intervention of the State in their behalf. When a trade or profession conceives itself to be underpaid, it remonstrates, and, if need be, strikes. The clergy have not yet remonstrated. They have not laid their case before the public. The world in general is not aware of the fact that there are literally thousands of clergymen scarcely removed by one degree from pauperism, hundreds of families suffering from actual starvation, and many widow and orphan children left in destitution. These painful facts have not been submitted to the public; they are only known through the reports of several societies which have been formed in the metropolis for the relief of clerical destitution, and from the advertisements inserted in a few periodicals devoted to benevolent purposes, in which "donations of food and clothing are requested for many clergymen in want of the necessaries of life." Let the clergy only make good use of the unusual facilities which their position gives them for influencing the charities of the nation, and we promise them a speedy reduction of their distress. A pauperised clergy is a social evil, a social disgrace, a social danger. If the ministers of religion are made contemptible or ridiculous through poverty, then religion itself is degraded in their person. This the public mind will not be slow to perceive; and it is the duty of every clerical man to call attention to the poverty of his own order.

We will do the clergy the service of removing one misconception which might shut up the purses of many benevolent persons. It might be generally supposed that although the stipends of a large proportion among them are wretched in the extreme, yet deficiencies are commonly supplied by private property. That this is not the case is abundrntly proved by the number of cases of poverty brought to light by the secretaries of the various poor clergy relief societies. The annual number of candidates for deacons' orders is about six hundred. Of these a large proportion consist of "poor scholars," who have adopted the clerical profession in the hope of making their way to a respectable incumbency by diligence and good conduct. It might be said that such men have no more right to complain, if they are disappointed, than the unsuccessful followers of any other profession. They were not obliged to become clergymen. They were, or ought to have been, aware, of the chances in the Church; and are now only reaping the consequence of their own decision. But the chances in the Church are small beyond calculation, and at present are diminishing by the continual despoiling of good benefices. In other professions it is only the incompetent or the idle who do not eventually succeed; but in the Church it is of little use to be a clever or an exemplary man. Moreover, after all, the motives which induce a man to take Orders can never be quite reduced to the level of those which operate in the choice of secular professions. It is unquestionably a great hardship that a man should be visited with the miseries of extreme and hopeless poverty in return for obeying the highest and most generous dictates of his conscience.

PHILANTHROPIC DELUSIONS.

THE name of Mr. Hopley has appeared more than once in the pages of this journal as the author of "Wrongs which cry for Redress;" wrongs which he agitated successfully to get righted, and in the redressing of which the Eastbourne tragedy does not justify the supposition that he was an insincere advocate. With Mr. Hopley as an individual, apart from the question of labour in the Bleaching and Dyeing Works, this paper has no connection, and on the gradations of guilt to be imputed to him in the death of Reginald Cancellor it has no right to offer an opinion. But Mr. Hopley's friends appear to think differently, by submitting to the judgment of the philanthropist a "Plain Statement of Facts bearing on the death of Reginald Channell Cancellor." Therefore it is not unfair to comment upon the unfortunate delusions of the author.

Granting every fact of his dealings with his unhappy pupil to be simply and precisely as he states them; granting that the evidence of the cowardly women who never stirred or spoke while (according to their own statement) a half-witted boy was being unmercifully beaten for two hours is little to be depended on; granting Mr. Hopley's conduct and motives to be all that he himself believes them to have been; still he only clears himself of cruelty by proving insanity—such insanity as any monomania unrestrained might end in, and under which crime is justly prevented from sheltering itself.

Mr. Hopley's monomania was ostensibly education in itself, practically it was himself as an educator. He believed in himself through that "punishment!" and its consequence; he believes in himself still. For fifteen years he has been planning a "Model Educational Establishment," the building ground of which was in preparation before the trial. Of this he was to be the master and the mainspring. But conceiving such a thing incomplete without a mistress "fully alive to her great responsibilities," he marries a young girl, to be trained—by *himself* again—as "an example to wives, and, if Heaven should so permit, to mothers." The wondering disgust with which the fact of her lighting her husband and young Cancellor upstairs, and then leaving the boy to his fate, strikes upon the mind, subsides into pity at this statement. A "very young girl," after six years of Mr. Hopley's educational influences, in so near a relationship, could have retained very little intellectual or moral responsibility at the end of them. And when we read in the "Statement" that coarse anonymous letters are daily addressed to her, now, when the deed is done, the cowardice irreparable, pity becomes too engrossing to allow any further mention of her.

In this Model Educational Establishment, in its model educator, Mr. Hopley still believes; for it he still hopes to live:—

"Readers, there is but little more to say touching my grave indiscretion; if a jury of my countrymen, having had the whole facts of the case put truthfully before them, pronounce me guilty, be it so. God forbid that I should entertain the slightest wish that one single day should be diminished from what an English judge may consider a proper term of punishment. Let the large blot remain upon my character. But is the blot so large that it is to spread itself over everything fair throughout a whole life? so that *all* is now to be a blot? This is the question which you have to determine.

"There's the building ground arranged, and ready for the model. There's the model, the result of so many thoughtful years, ready for the ground. There are educational lectures ready for the press. There are educational aids and contrivances all ready for use. And above all, there's the young wife toiling—toiling, though penniless, to fit herself for her future calling—and children to be trained in accord-

Digitized by Google

ance with the evening prayer "to be blessings to their country, helps to the world, chosen instruments to carry out God's will." And there in his narrow cell sits the worker—his body imprisoned, but his soul as free as ever—humbled and chastened before the Lord and before the just and good on earth, but erect and unsubdued before the malice of the world, and panting to fulfil his sacred mission. And you have to pronounce—you, the reflecting and noble-minded of the country, have to pronounce through judgment not of *one* deed but of his *life*, whether you accept his services or vote that he be thrown away."

This may be the language of unblushing impudence, but the probability inclines to its being that of impenetrable self delusion. It is impossible not to wish to Mr. Hopley hereafter—as to any other discharged prisoner—a fair start to gain an honest maintenance; in any calling *except* that of a Model Educator.

Reviews.

What to Learn and what to Unlearn. By the Rev. HENRY FEARON, B.D., Rector of Loughborough, and Honorary Canon of Peterborough. London: Rivingtons, Waterloo-place. 1860.

THIS is a reprint of three lectures delivered at Loughborough and Leicester to different Societies and Institutions: on Common Things; on Working Life; and on Mental Vigour.

The first may in some measure be called a lecture on education, as it is on the teaching of common things.

Acknowledging the progress of the machinery of instruction in the present day, the number of schools for all classes, and their capabilities for putting the elements of acquiring all knowledge into the power of the scholars, Mr. Fearon goes on to consider education in its deeper and wider sense, as the development of a child's highest powers of body and mind, and their adaptation to his work in life. The complaint that working-class education is not advancing in a practical direction is often made, and with some truth; yet the difficulty of making it more industrial would be very great in first-class National and Government schools. The parents of the children who cram geography and history to supposed excess in these schools, are a very touchy class, and in many cases would prefer their children learning what was of no use to them to having them treated as being in any imaginable way unfit to be taught anything that higher class children learn. As to the second and third-rate schools, the children stay at them too short a time to learn enough of anything; and probably, if these schools could be made partly industrial, the parents would make greater effort to prolong their children's attendance. Mr. Fearon's suggestion that the elements of scientific knowledge should be taught, bears more on common things than the first impression given by the word *science* might imply; as he illustrates on many familiar subjects. This sort of instruction would satisfy the ambition of the parents, while it met the real wants of the children's preparation for actual life. And some parents are quite capable of appreciating what is and is not practically useful in their children's education.

" . . . The subjects of instruction should in some degree depend on the occupations in the particular neighbourhood. In the mining districts a knowledge of geology is exceedingly useful; and I heard from a gentleman the other day, who superintends a large mining property in Cumberland, that the miners actually will not send their children any longer to schools, unless the rudiments of such sciences as will be required by them in their particular employment in life form a part of the instruction which they are to receive. I would guard myself, however, against being supposed to be proposing any list of the subjects which we ought to teach. I merely select a few instances which strike me—and I dare say much better examples might be chosen—for the purpose of illustrating the principle for which I contend, that a certain amount of scientific knowledge is eminently useful to all, and especially for the working classes. It may, however, perhaps be collected from what has been said, as well as what is to ollow, that the two sciences, mechanics and chemistry, have the most intimate connection with the common things of every-day life, and that any one who is entirely ignorant of them will continually find himself at a loss."

. . . . . .

" Besides weightier reasons for giving an insight into the subjects here recommended, it is very desirable to cultivate in the young all things which, as they grow up, will afford pleasing topics of conversation. This, I am disposed to think, is a great desideratum with the humbler classes. Not having minds stored with useful information, they have really very little to talk about; and so perhaps they gossip for a whole day about some trifle of what their neighbours are doing—the most uninstructive of all conversation. We must do all we can to make what is taught form a basis for further information, which will be picked up when the observation is awakened. And I must say that I agree with one of her Majesty's inspectors, who says that in this point of view science is of more consquence to the poor than literature.

" Drawing we must account a very valuable art for a person in any class of life whatever to possess. It is satisfactory to see that it now receives so much attention in schools. Besides its intrinsic usefulness in enabling us to reproduce what we have seen, the realising of graceful forms by the pencil is found to have an improving influence upon the taste and feelings. Cultivate also class-singing by note In Germany this forms an integral part of every person's education, and with good effect, unquestionably, in softening the manners, and affording a delightful relaxation for the heart under its cares. Last autumn I heard a whole regiment of the German Legion, 700 or 800 strong, singing their national airs as their columns marched along the road from Dover to their camp at Shorncliff. They sang in perfect time, as all Germans do, and it was delightful to listen to; and I cannot doubt that it relieved very much the tedium of the march.

" You will observe that my remarks have been applied to the schools of the working classes; for though I am of opinion that a larger infusion of subjects called for by the growing knowledge of the times might be advantageously introduced into the great public schools, yet the classes whose sons attend these schools are quite able to take care of themselves; while the working classes, who have generally not much choice of schools, are obliged to take such as they can get, such, in fact, as are brought to them. Being, moreover, little qualified to judge of such matters, they are dependent on the plans which may be devised and carried out for them by others."

The second lecture on Working Life, in speaking of the miseries produced by drunkenness, and the stand made against it by temperance societies, draws attention to the fact that it is not pure beer, or any other wholesome beverage such as might lawfully refresh a working man after hard labour, which causes drunkenness. It is the drugged concoctions sold under the name.

" Undoubtedly you cannot exaggerate the evils which drunkenness produces, the quarrels, the miseries which it imports into the life of the working family; wives beaten, children starved. The judge on the bench proclaims all this, the chaplain of the gaol confirms it, nobody doubts it; but how best to meet the abomination, by what wise and well-considered measures it may effectually be grappled with, that is the perplexing question for the philanthropist, and especially for the statesman. They who succeed in stripping the question of things which do not necessarily belong to it, and thus prevent confusion of ideas concerning it, will indeed do good service to society. Do not, then, attribute to beer what is caused by beershops. That is the legislative part of the question. Do not lay solely to the charge of malt and hops what is due to cocculus Indicus, tinctured with tobacco, and spiced with grains of paradise. That is the dietetic part of the question. Help the temperance cause by working out some important changes in the beerhouse system and spirit-shop system. Put the saddle upon the right horse. Strain every nerve to prevent the sale of poison under the name of drink. The drunkards would then be reduced to

Digitized by Google

the smaller number of those *determined* to be drunk. This would be a great point gained, and you would rescue from that vice the great majority of its victims, namely, those who have been stimulated to drink more and more by the abominable fluids which have passed down their throats—those whom the gin-palace, with its broad windows and its flaring gas, is luring night by night to their destruction. These places, by the temptations they offer and the liquids they vend, are the inciters to everything that is demoralising and wicked, and are the worst obstacles to the introduction of more sober habits among the people."

The improvement of dwelling-houses is also strongly urged, and statistics are given of the cost and returns of many of the model lodging-houses in London. From 4½ to 6 per cent. appears to be the average of profits upon money so laid out.

"It must be admitted, however, (so eminently commercial a people are we) that you make an immense stride towards effecting any improvement, if you can show that it will be remunerative. A dividend spurs our philanthropy wonderfully. I saw an advertisement a few days ago, headed 'Consumption of smoke made profitable.' Aha! thought I, now we shall get rid of smoke; I will back that advertisement against a good many Acts of Parliament. But it has been shown over and over again that everything which is expended to contribute to the general health does repay the outlay in a variety of indirect ways: in reduced poor rates, in increased capacity for labour, and augmented national wealth. In this sense it may be truly prophesied of a benevolent man, 'Look what he layeth out, it shall be paid him again.'"

The third lecture upon Mental Vigour treats more exclusively on the intellectual training of the upper classes, "the competitive wrestle" which every examination at school or college now entails, and the good and evil which such stimulus produces.

"Competition, it is true, is a necessity of our times. But if we admit that the object of education, rightly understood, is to develope all the powers of the body and the mind equably, we shall consider competitive examinations valuable only in proportion as they enable us to determine the cases in which this important object has been most fully attained. Especially will care be required lest, in the preparation for them, the organ of the mental powers be forced, in early life, into unnatural and diseased activity.

"In fact, the very merits of our schoolmasters at the present day, and their earnestness in their work, have the effect of increasing rather than modifying this difficulty. For they minister to that excess of juvenile study, to which we look with apprehension. Our youth, now-a-days, have certainly their education as it were 'turned on' upon them. They are the raw material put in, to come out the complete manufactured article, to a given pattern, at a given day. It provides us with a plentiful stock on hand; but let us exercise a little caution, lest we reduce all minds, so tested, to a dead level of mediocrity."

. . . . . .

"It is in mental as in physical philosophy—we can gain no certain data except by a long observation and record of facts: and even a single instance gives at least the negative evidence, that for a mind to arrive at extraordinary vigour it is not an essential condition that it should be made to undergo rigorous ordeals in boyhood and early youth. An example may be faulty in many respects, and yet may exhibit a certain portion of truth, to which we should not shut our eyes. As parents or instructors of youth, we must take care to warn them against follies and vices, and from idleness, by which those evils are proverbially engendered. But it is equally imperative upon us to prescribe the measure of mental exertion which is beneficial and safe, and peremptorily to forbid excess.

"One word more as to what has been advanced, of which the sum seems to be this. We contravene a great law of Providence when we attempt to accelerate those mental developments to which time alone can effectually conduct. Time is a necessary element in all things human. Whatever is to have strong roots must have deliberate growth. Nature desires to be assisted, not forced. By attempting to crowd too much teaching into too short a space of life, you simply obstruct her operations; and with equally injurious consequences, whether in the age of childhood, boyhood, or youth. You cannot hasten what she in due time will achieve, although you may injure the machinery by which she is gradually and beautifully bringing her work to perfection."

Correspondence.

REMARKS on the Debate in the House of Commons, as reported in *The Times*, on Sir John Pakington's motion:—

"That the grants annually made by Parliament for the promotion of Education ought to be expended with fair and just regard to the requirements of the different classes of schools recognised by the Minutes of the Committee of Council, and that Ragged and Industrial Schools, which are alone adapted to meet the wants of a considerable number of destitute and neglected children, do not receive the amount of aid to which they are therefore entitled."

To the Editor of the Philanthropist.

Sir,—The debate on Sir J. Pakington's motion on going into Committee on Supply on Education Estimates may appear to many of your readers simply a discussion whether certain regulations of the Committee of Council on Education are, or are not, just,—whether certain schools ought or ought not to receive a larger grant; a mere question of pounds, shillings, and pence, unworthy of further consideration, and which was set at rest by the Vice-President of the Council. If it were so I would not further trouble the public, or beg the favour of a little space in your valuable columns.

But Sir J. Pakington's motion is based on a principle involving the welfare of millions of the juvenile population, and the increased or diminished expenditure of the country in the punishment of adult criminals in prisons, the support of paupers in workhouses, and of juvenile delinquents in Reformatories. The subject cannot, therefore, be unworthy of your columns, or of the serious consideration of your readers.

The question at issue is really this:—Is a large portion of the population to be excluded from educational aid, that being the portion from which the bulk of our criminal and pauper population is derived? Are the children who are "destitute and neglected," and who by reason of their condition cannot attend the National and British Schools which are largely helped by the Council on Education—are these, the poorest and most helpless children in the country, to be left without help, and sink as they do sink into pauperism and crime, thus to be educated expensively in workhouses and Reformatories, at a cost to ratepayers and to the Government of 10*l.* to 18*l.* per annum, besides the additional funds raised by voluntary benevolence?

We believe that no one who is not shackled by prejudice or official punctilio, and who is simply guided by common sense and sound political economy, as well as by Christian benevolence, would hesitate to admit that if educational aid is granted by Parliament to any portion of the population, it ought to be so especially to this class, both as the only means of enabling these poor children to become useful members of society, and as the simplest preventive measure that can be adopted.

Parliament has shown itself anxious for the education of the people. While not prepared to admit the principle of compulsory Government education, all that without this can be done is done by the House of Commons to secure the education of the people. Criminal children, the "children of the State" in a peculiar sense, are provided for in Reformatories, an authorised inspector being appointed to ascertain that a sound secular, moral and religious education is provided for them. Pauper children while maintained by the ratepayers, are educated by the Government, for an annual grant of 30,000*l.* per annum is made to the pauper schools for education, excellent teachers being appointed, some of whom receive through the Council on Education as much as 60*l.* per annum, in addition to their board. An Educational Parliamentary Grant is annually made "to promote the education of children belonging to the classes who support themselves by manual labour." 'The means consist in aiding voluntary local exertion, under certain conditions, to establish or maintain schools." Every school assisted from the grant must be either (*a*) a school in connection with some recognised religious denomination; or (*b*) a school in which, besides secular instruction, the Scriptures are read daily from the authorised version." All the schools aided are either "elementary" or "nor-

Digitized by Google

mal," the latter being boarding schools for training school teachers. In "elementary schools the children attend from the homes of their parents, and charge is taken of them during school-hours only," except in a class of schools, the certified industrial, now by a recent Act placed under the care of the Home-office, as intended for children under magisterial sentence. These definitions are copied from the "preliminary chapter" of the educational "code," ordered by the House of Commons to be printed in April last. There is nothing here to exclude ragged and industrial schools which alone have grappled with the great existing evil of a mass of uneducated, destitute and neglected children, and which are adapted to their wants, and have been found to succeed in their efforts. On the contrary, they fulfil all the conditions here mentioned; they are founded and maintained by double or treble the amount of voluntary aid needed for National and British schools, because as they receive no school pence the deficiency must be supplied by voluntary contributions, and because all institutions intended to prevent or reform evil are far more costly than those for the well-regulated;—and finally, they are absolutely "elementary schools," because the children "attend from the homes of their parents," and charge is taken of them during school hours only, *i.e.*, they are not boarding schools essentially, and need not be aided as such, because whatever addition is made to the charge of the children during school hours is undertaken by voluntary benevolence, and ought not to be supplied by an educational grant. Why, then, it will be asked, is educational aid not given to Ragged and Industrial schools?

The right hon. member for South Staffordshire, the late Vice-President of the Council, states that there can be no doubt that the primary object of an educational grant should be the poorest and most destitute; but asserts that "just and essential conditions should be complied with in making grants to these schools," and that it would be a "most unsafe and unwise proposition that they should give large grants without inspection to any schools, under whatever management, which might be called Ragged Schools." We do not deny this; no school managers ought to have any aid who are not willing to submit to "just and essential conditions," framed in adaptation not to any particular and individual school, but to meet a general want and to carry out true principles; no public money ought to be given to schools without such full inspection as would prove that it was devoted to the purpose intended. We court inspection, and desire to conform to just regulations. Being one of the managers of a Ragged School frequented by the lowest of the population in the centre of a densely inhabited district of a maritime city, I can state from personal knowledge that from its commencement, more than a dozen years ago, it has been placed under the inspection of the Council, and every possible effort has been made respectfully to conform to its regulations, receiving warm approbation from four different inspectors. This, sir, is not the reason why Ragged Schools are not aided. Those who desire Government help are willing to submit to just regulations. But the present regulations exclude them from educational help. In 1855 this school received under the minutes for common "Elementary Schools" 113*l.*, being less than half of the actual expenditure; in 1858 under the present minute only 36*l.* were received, *i.e.*, not one-sixth of the expenditure. The school never came under the minute of 1856, because the managers could not conscientiously ask any Justices of the Peace to sign the required certificate respecting their children. It was as follows:—

"We, A. and B., have satisfied ourselves, through the police, and by other means, that the young persons received into this establishment have either been legally convicted of crime, or have been accustomed to begging and vagrancy, not having any home or settled place of abode, or proper guardianship, and having no lawful or visible means of subsistence."

It is evident that Reformatories are the proper places for the first of these classes, and Union Industrial Schools ought to receive the second; at any rate Ragged Schools or Free Day Schools could not; they were thus absolutely excluded from help, by this test.

Now, sir, to prove that the Council will not give educational help to the Ragged Schools, it is sufficient to quote the "instructions" given to her Majesty's inspectors of parochial union schools, explanatory of the minute, dated Dec. 31, 1857, relating to certified Industrial and Ragged Schools:—

"No grants (except those for the purchase of books and maps) will be made in aid of the purely scholastic instruction, unless a certified teacher be employed."

That there may be no doubt of the determination of the Council not to give the smallest educational aid, the inspector is directed to exclude from the application for rent all parts of the premises which are employed solely for intellectual instruction, as well as those other parts, somewhat expensive in a crowded city, which are so important to the work, recreation ground, bathing houses, &c.

"The allowance for rent made upon any buildings, not being part of a school certified under one of the Industrial School Acts, will be apportioned so as to exclude from account all parts of the premises which are not used for industrial instruction. It is the intention of the Minute to pay half the rent of such rooms only as, but for the industrial work, would not be wanted."

The present minute (that of 1857) does not grant any pupil teachers nor any capitation grant for attendance, and no grant is made to masters who obtain the workhouse certificate in a Ragged School until after having been well reported in it for three years. (*Vide* section 6 of the minute of Dec., 1857, on Certified Industrial and Ragged Schools) Yet the Vice-President stated that Ragged Schools "can receive money for pupil teachers on the same conditions as any other schools, if they choose to comply with them," that there is "open to the Ragged Schools every grant which is open to the elementary schools." "Nay more; they have open to them certain privileges which other schools do not enjoy; in the first place the capitation grant is only given in ordinary cases with respect to children who pay a certain amount in school pence. These Ragged Schools receive no payment whatever from the children, yet they are allowed the capitation grant." (*Vide* Report of Mr. Lowe's speech in *The Times* of Wednesday, Aug. 15, 1860.) These statements appear so extraordinary, while the official documents remain unrepealed which have been quoted, that we would willingly believe that the speech has, here and elsewhere, been incorrectly reported. If this is the case, we shall be glad to have the errors corrected. Now, it is through the grants to pupil teachers that large sums are granted to National and British Schools. Sir J. Pakington mentions a school, and it is not a singular instance, in which as much as 332*l.* were given by the Committee of Council in 1858, exclusive of rent, the sum raised by voluntary contributions being only 84*l.*, that is, not one-fourth. No pupil teachers are allowed in Ragged Schools, and very properly, because, as experience has proved, such schools are not fit places from which to select, or in which to train, the future teachers of the nation. With respect to certificated masters, we have no objection to them, provided they are otherwise fit to undertake a situation requiring much self-sacrifice and varied qualifications, for which intellectual qualifications are no guarantee. Industrial training alone is somewhat aided by a grant of one-third of the cost of material, and a capitation of five shillings per annum of each industrial scholar. Under former minutes for industrial training in common elementary schools, 10s. per head were granted with a gratuity of 5*l.* to each industrial teacher. Nothing now is given to aid even industrial instruction: but we ask for help in giving intellectual education.

A passage from a pamphlet of my own is quoted by Mr. Lowe, which, removed from its context, gives a very different meaning from what I intended by it. I will therefore beg to give the whole passage. The pamphlet quoted is probably that entitled, "Claims of Ragged Schools to Pecuniary Educational Aid from the Annual Parliamentary Grant." (London: Partridge and Co.) Having in page 7 mentioned the nature of the minute of June, 1856, as admirably meeting the wants of Ragged Schools, in providing suitable instruction, and the conditions under which the grant would be made—conditions which I consider most just, and which I believe would secure the funds of the Council from misapplication—I proceed to point out, page 8, the real cause of the difficulty:—

"Another clause made, however, a provision to meet a class of schools involving a different principle. The true Ragged or Free Day Schools provided education only without food. Wherever this was given it was by individual charity. But in Manchester and Liverpool large Industrial Ragged Schools had been established where the children were kept the whole day, and consequently fed. To meet the wants of these, a capitation grant of 50s. per annum was given for every child fed at the school. Now this was certainly an error in principle; food should have been provided from other sources than an educational grant. The natural consequences ensued, 'namely, from the offer of 2*l.* 10s. per annum for

Digitized by Google

each child for one meal of food per diem,' that numbers of schools, allured by this promise, and by what was imagined an easier method of obtaining Government aid than in ordinary pay schools, designated themselves Ragged Schools: and a large number of refugees of various kinds were, in the instructions to the inspectors, admitted to participation of the grant. Now these refugees and other institutions, whether for discharged prisoners, for the rescue of fallen females, or for houseless children, were, doubtless, important and valuable, and probably fit objects for Government help, or aid from parochial funds, being instituted for the protection of society as well as for the reformation of the individual, and the support of the destitute. But their claims stand on totally different grounds from those of Ragged Schools. They could not fairly be helped from a purely educational grant, and their admission to its benefits, in addition to the grant for feeding in Ragged Schools, caused so enormous an addition to the previous expenditure that it was thought necessary to retrench."

The Vice-President (Mr. Lowe) appears to be under an entire misapprehension as to the nature and objects of Ragged Schools. He calls them "an inferior type of schools," for which larger sums of money are requested on easier terms. "Then," he says, "there would be a run upon the Government for these grants," and, if it were found that larger grants of money could be thereby obtained, school children would, in a vast amount of cases, be described as ragged, disrespectable, poor, and destitute, and unfit for human society." Ragged schools need not be, and ought not to be, "inferior schools," but schools as good as others in fitness for the end intended. With the largest grants we have ever asked for, they are far more expensive to the managers than the pay schools, as the figures already quoted prove. Good and well-managed Ragged Schools do not lure the children from pay schools, for which might be cited the authority of British and National schools in their immediate neighbourhood. And as to calling the children "disreputable," "unfit for human society," we have too much regard for English principles of justice so to designate them; too much reverence for their immortal natures so to regard them. The real class of children for whom the Ragged Schools are intended, is, in reality, absolutely excluded from the educational code above quoted, though the name of the schools is admitted. These schools are there defined as intended for 'children who have no home, or no reputable home." How can children who have no home attend a day school? Who is to decide whether their homes are "reputable?" Some of the wealthiest in our country may not be reputable in a Christian or moral sense, and some of the poorest from which the children attend may exhibit no ordinary Christian virtues. Mr. Lowe must be unacquainted with the class, since he presumes the class not to exist. He tells Sir J. Pakington that he cannot trust her Majesty's inspectors, and yet they are elected by the Council, and dependent on it. If he could trust them, he might know something of the class, for the Union Workhouse inspectors could tell him that at least three-fourths of the pauper children received into those institutions have been below the influence of National and British Schools, and are the very class with which the Ragged Schools attempt to grapple. Other inspectors who have visited these schools at once perceive that the children in them, though clean and orderly, are utterly unfit for the higher schools. But Mr. Lowe cannot receive their testimony. The managers of the schools, also, are not trusted by him. What facts have occurred to justify a distrust of the managers of Ragged Schools, which does not seem to be entertained respecting the managers of other schools? And why are persons who engage, at no small pecuniary cost, in the most arduous and least inviting of tasks, to be thus attacked from a quarter to which they might not unnaturally have looked for defence and protection. The magisterial certificate, also, Mr. Lowe found ineffectual, for the magistrates, and also the police, are so thoroughly aware of the existence of a large number of neglected and destitute children from whom spring the young criminals, and of the importance of these schools, that they were anxious to help those who supported them, and, therefore, in some cases granted a certificate without too strictly inquiring whether it was literally correct. Whence, then, does Mr. Lowe draw his conclusion that the class does not exist which is so strangely excluded from educational aid? If he could not himself visit the neglected districts of large cities, personally, to ascertain their condition, had he inquired of Lord Shaftesbury and others, who have made such investigations, they could well have described to him the condition of these destitute and neglected children, for we do not and will not call them "criminal and abandoned;" they could have well pourtrayed their actual condition, and shown them swarming uneducated in every large town. The masters of the pay schools are well acquainted with the existence of a class of children below their own, whom they would desire to see educated in Ragged Schools, rather than interfere with their own children in the streets. Our legislators, also, are aware of the class, for Lord John Russell, when addressing a Ragged School at Sheffield, in 1857, thus spoke:—

"It is absolutely necessary, as it appears to me, that for the present, at least, the voluntary efforts of those who love mankind, and have a feeling of regard for their neighbours, and for the safety of society, should combine in endeavouring to provide by what are called Ragged Schools and by schools of a similar description, a supply for the wants to which I have adverted. I believe that if these wants are supplied, although we can never hope in our most sanguine expectations that temptations will not divert many from an honest and religious course, yet that the number of those who are sent to prison, who not having originally vicious inclinations, have been perverted by bad example and the circumstances of their position—that the number of those who are criminally punished will very sensibly decrease, and society be a great gainer thereby."

And Lord Derby, when during the last month he laid the foundation stone of a Ragged and Industrial School at Kirkdale, thus pointed out those children:—

"There is a class of the population untainted with crime, above the condition of the absolutely destitute poor, yet below the scale of what may be called decent poverty, for which neither in criminal Reformatories—for which they are not fitting subjects—nor in the workhouse—to which they are either not admitted, or which they are unwilling to enter—is any provision made; and who, except by the instrumentality of institutions similar to that of which I am laying the first stone to-day, must grow up inevitably from idleness to vice, and from vice probably to swell the lists of a criminal population."

Is this class of the population, sir, always to be excluded from help? and still must it be, as is well said by one of her Majesty's inspectors:—[*Vide* General Report of H.M.'s Inspector, Rev. W. H. Broadfield, 1857.]

"The lost sheep are left to wander neglected in their wilderness of ignorance; reversing thus, as applied to instruction, the principle of that characteristic maxim of the Gospel which indicates sinners, not the righteous, as claiming the most vigilant regard. Surely the teacher comes to teach not only the steady, the sober-minded, the apprehensive, the industrious, and the naturally intelligent; but to cultivate what has hitherto been barren, to awaken the torpid, to stimulate the indolent and listless, to encourage the timid, and to search out and breathe upon the latent sparks of intelligence that have been suffered almost to expire. This disregard for the dull or idle I believe to be one of the mostfruitful causes of the low aggregate of attainmen in many of our schools."

There is one point more which must be adverted to, because the figures presented by Mr. Lowe may appear to contradict our assertion that educational aid is not given to Ragged Schools. He mentions that 27,000*l.* were given to these schools in 1858, and 18,000*l.* in 1859. Now those sums, while appearing large, are really insignificant when compared with 252,550*l.* given to pupil teachers alone in the higher schools, an aid from which these Ragged Schools are excluded, not to speak of 86,000*l.* in augmentation of master's salaries, and 750*l.* for teaching drawing. But these grants were made under the minute of 1856, which granted a capitation of 2*l.* 10s. on every child fed, and which included institutions for adults as well as for children. This minute continued in operation until March, 1859; hence the size of the sums mentioned, and not because help is given to education.

He also gives us an account of an industrial Ragged School which received in 1859 the sum of 1,691*l.* (we presume under the minute of 1856), and which this year had received 1,047*l.* (*i.e.*, under the present minute). We should have wondered how any industrial school could obtain so much, but Mr. Lowe fortunately explains it. There were only 25*l.* granted for capitation grants, therefore there could be only 100 industrial scholars, yet there is a grant of 150*l.* for rent, 200*l.* for paying teachers, and 665*l.* for raw materials. How this can possibly be we will not venture to inquire, but we may say that the Government need not fear that Ragged School managers would often give 300*l.* per annum for premises calculated for 100 scholars, and that we think that they would have no right to ask for half of so exorbitant a rent; as only 20*l.* is given in augmentation of salary in an industrial school, it is astonishing how so many can be employed for so small a number of children; and as to the grant of 665*l.* for material, implying an outlay of 1,995*l.* per annum for raw mate-

Digitized by Google

rial worked up in the school, it is evident that such an enormous quantity must, under the superintendence of so many teachers, of course well-trained, have returned with large interest to the funds of the school, and that it is not right so to spend the public money on one school, any more than to give 750*l.* for teaching drawing, while thousands or even millions of children are in our country who cannot read their Bibles. Mr. Lowe states that he is "oppressed by the high moral position which the right hon. gentleman (Sir John Pakington) had taken up." Sir, we believe that the right hon. member for Droitwich is not the only one in the House of Commons who is prepared to take up and to maintain "this high moral position," and we know that a high moral position, and a Christian position, are not inconsistent with the position of a sound political economist. They are all in true harmony with each other. We ask for justice to these children and to the country. Let the country judge.

I remain, sir, yours sincerely,

MARY CARPENTER.

Bristol, Sept. 1st, 1860.

FISH IN TIMES OF SCARCITY.—Let those of us who live on the coast see that an understanding is established between inland consumers and the fishermen, who are usually slow in hearing of public affairs. There ought to be no burying of tons of good fish in the sands, or rotting of them for manure, to keep up the price, under the notion that only gentry eat fish. Let every basket be sent by the nearest railway to some inland market; and, once more, let some pains be taken inland to get the fish under the notice and command of the classes who want it most. There are many small towns, villages, and populous road-sides, where the labourers never see or hear of fish, except as a luxury which comes to the squire's. A little zeal and attention on the part of public-spirited men would easily have brought mackerel into 10,000 cottages this dear spring, and may yet bring shoals of herrings among the labourers during the yet dearer autumn which is to come. At best we shall not have nearly the quantity of fish that we ought; but let us have as much as we can.—*Once a Week.*

HOMES FOR YOUNG WOMEN.—The Association for the Christian and Domestic Improvement of Young Women was formed to provide lodgings, at a moderate price, having something of the character of homes, for the many young women who, whether employed or seeking employment in London, are often in a position of dangerous and comfortless isolation. The association has been in operation for some years, and a recent prospectus states that it has now open four "homes," the North London, in Charlotte-street, Fitzroy-square; the West London, in Great Marlborough-street; the Crawford-street Home, and the East Central, in Chatham-place, Blackfriars. In these houses respectable young women may obtain a safe temporary lodging at very moderate rates. In the Crawford-street establishment the cost of board and lodging is only 5s. a-week. Combined with these homes, there are arrangements for providing moral and religious instructions to the inmates, by means of Bible classes. The society wishes to extend its operations through other districts of the metropolis, and makes a strong appeal to the support of the Christian public. The Earl of Shaftesbury is president of the society, and the council of management includes the names of the Countess of Gainsborough, the Countess of Ducie, and the Hon. Mrs. A. Kinnaird. The bankers of the association are Messrs. Ransom and Co., Pall-mall.

THE METROPOLITAN WATER SUPPLY.—A plentiful supply of good wholesome water is hardly less essential to the health of a great city than a plentiful supply of good wholesome bread; and it is just about as difficult to obtain the one article free from adulteration as the other. The man who brings within the reach of 3,500,000 Londoners that simplest, but unquestionably not the least rare, of all beverages, drinkable water, will be a benefactor to his kind; and will deserve to be—as he no doubt would be—immortalised by thousands of those drinking-fountains, the equivocal nature of whose contents at present make them a doubtful boon to the *gamins* of the community. No Father Mathew could render one-tithe of the service which such a person will do to the cause of temperance, when by his exertions the first city in the world is relieved from something like the reproach implied in the complaint of the *Ancient Mariner*—

"Water, water, everywhere; but not a drop to drink!"

Purity, indeed, as applied to water, is but a comparative term, there being no such thing in all the cornucopia of nature as absolutely pure water; but surely it is perfectly possible to obtain this prime necessary of life unimpregnated with sewage and even fouler substances, which filtration and other ingenious contrivances can never wholly eliminate. All who are interested in the sanitary condition of the metropolis will therefore be glad to have their attention directed to certain water springs at Grays, in Essex, a village about twenty miles from town, and having a station on the London, Tilbury, and Southend Railway. These springs exist in the spacious chalk quarries belonging to Mr. Richard Meeson, situate about a mile from the margin of the Thames; and when undisturbed, they rise to a height varying from four to eight feet below Trinity high-water mark. Mr. Meeson's quarries form part of a mass of chalk extending from Purfleet to Little Thurrock, and covering a superficial area of about five square miles. Over a space of sixty acres the chalk has been dug out to the level of the springs, and the attempts to penetrate deeper for material led to the unexpected discovery of a most abundant supply of excellent water, which it appears that a careful scientific analysis shows to be entirely free from the presence of organic matter, and to be highly suitable for domestic and other purposes. The flow of water has caused great obstruction to the labours of the quarrymen, who have to resort to pumping to keep it under. The water may be seen simultaneously bubbling up from apertures in the bottom, and gushing in copious streams from fissures in the sides of the pits. The workmen have enough to do to restrain it within something like bounds, having for this purpose to close up the rents in the rock with strong brickwork. When accumulated in a species of natural basins scooped out of the chalk, the water presents a clear blueish tint, the intensity of which increases with the depth of the contents. In a decanter it is perfectly pellucid and colourless, and when tasted, is remarkably cool, fresh, and agreeable. Every twenty-four hours the springs give out 2,100,000 gallons of this precious liquid, which are at present entirely wasted, or, at least, are of no further use, save in so far as they contribute to cleanse Father Thames, into whose channel they ultimately discharge themselves. This state of things has been going on in the Grays quarries for many years past, with the same results. The water has been worse than a drug, it has been an actual impediment to, and is almost the despair of the quarryman. Heavy expense has to be annually incurred in pumping, to get rid of it; and, as the volume undergoes no perceptible variation in quantity or quality as time rolls on, it has naturally occurred to those who have been constant spectators of so great a waste of Heaven's mercies whether what is now almost a curse to the pitman might not be converted into a blessing to the myriad inhabitants of the metropolis. By enlarging and deepening the excavations, and the employment of appropriate machinery to stimulate instead of to repress the liberality of nature, it is believed that a constant and inexhaustible supply may be easily obtained. With this view it is proposed to establish a company with a capital of half a million sterling, and to commence operations by meeting the wants of the intermediate towns and villages of Purfleet, Rainham, Dagenham, Ilford, Barking, East Ham, Romford, and Brentwood, which are at present very ill-provided for; and so gradually to work their way into the heart of the metropolis from its eastern extremity. To enable the water to be turned on at the top floors of the houses in the city, it requires to be raised 150 feet by machinery. The cost of raising each 100,000 gallons 100 feet is computed at 1s. Of the possibility of bringing this water to London without deterioration in its conveyance, and of selling it at a price which will give it the advantage in the market, practical men will best form a judgment. The aggregate supply now furnished by the seven London water companies is estimated at 80,000,000 gallons per diem, and it is obvious that, with the growing wants of the metropolis, the importance of opening up new and improved sources of supply cannot well be overrated.—*Times.*

TREASURER.

Stephen Cave, Esq., M.P.

SECRETARY AND LADY SUPERINTENDENT.

Miss Ellen Barlee.

The Institution for the Employment of Needlewomen has been formed to assist workwomen of good character, by obtaining work for them, and securing to them the full average remuneration which they would receive were they able to take the work directly from the establishments for which it is executed, instead of obtaining it through the agency of a sub-contractor.

It is calculated that the lower classes of needlewomen in London exceed 30,000 in number. Of these a large proportion working from 10 to 18 hours per day, do not earn more than from 2s. to 6s. per week. Taking into account the slack season, illness, and inability to procure work, many can scarcely average half that sum. It may reasonably be expected that each worker employed by the Institution will be able to earn from 5s. to 9s. per week, an amount on which they can at least subsist, and which will save them from the terrible privations, and consequent temptations to dishonesty and vice, with which they have now to struggle.

To make an Institution of this kind permanent, and worthy of public support, it ought not to be a merely charitable effort, but must ultimately be supported to, at least a great degree, by those who benefit by it. The women employed, therefore, will be required to pay a small percentage on their earnings, (say a penny in each shilling,) towards the necessary expenses of rent and taxes, fuel, superintendence, etc. A contribution to this amount from 300 women, earning, on an average, 1s. per day, would fully meet all the ordinary charges of the Institution. But some time must elapse before the Society can secure employment for so many, and in the interval, the same machinery being required, its objects can only be attained by the help of those who feel an interest in the class which it desires to benefit.

For this aid the promoters of the Institution would confidently appeal. They believe the Institution eminently calculated to promote industry and good conduct in the women employed, and to permanently improve their religious and moral condition.

They would gratefully acknowledge the kind assistance which they have already received, and which has encouraged them to commence their undertaking by engaging the premises they now occupy at 26, Lambs' Conduit-street. Here Work-rooms have been prepared sufficient for the employment of about sixty workers, with a dormitory for the accommodation of a few of the most friendless and destitute—women with families being allowed to take the work to their homes. Further subscriptions are absolutely necessary to enable them to carry out their objects effectively; and especially to provide a Guarantee Fund, from which the parties who intrust work to the Society may receive security if desired, and may be indemnified for any incidental loss or damage. Such additional assistance the promoters of this Institution would earnestly solicit, as well as supplies of work, to allow of their giving the women constant and regular employment.

A single Institution of the kind now established, can only partially provide for the wants of so numerous a class, but should this effort succeed, and sufficient funds be obtained, it is intended to open Branch Institutions in other parts of London.

The Institution is open to the inspection of Visitors from 10 to 5, each week-day Mondays and Saturdays only excepted.

Post Office Orders addressed to the Secretary may be made payable at the Post Office, 62, High Holborn, W.C.

Donations will be thankfully received by Messrs. Prescott and Co., Bankers, Threadneedle-street.

HONORARY SECRETARIES,
A. J. SCRUTTON, Esq., 81, Old Broad Street;
THOMAS SCRUTTON, Jun., Esq., 3, Corbet Court, Gracechurch Street.

GOVERNOR,
Mr. J. W. GORDELIER, at the Institution.

Fifty youths are maintained at an annual average cost of about £1000.

Contributions are earnestly solicited, and will be gratefully acknowledged.

REFORMATORY AND REFUGE UNION.

PRESIDENT: The EARL of SHAFTESBURY.
TREASURER: ROBERT SMITH, Esq., 1, Lombard-street, E.C.

HONORARY SECRETARIES:
ROBERT HANBURY, Esq., M.P., 10, Upper Grosvenor-street, W.
STEPHEN CAVE, Esq., M.P., 35, Wilton-place, S.W.

BANKERS:
Messrs. SMITH, PAYNE & Co., 1, Lombard-street, E.C.
Messrs. RANSOM, BOUVERIE & Co., 1, Pall Mall East, S.W.

Contributions are earnestly solicited for the following purposes:—

GENERAL FUND.—For maintaining the general operations, corresponding with the various Institutions throughout the country, procuring the admission of convicted or destitute persons into suitable asylums, publishing Handbooks of information, and generally assisting in the work of Reformatories.

REFUGE FUND.—For making Grants towards the support of existing Institutions, and aiding in the formation of new ones where found necessary; contributing towards the Emigration of those whose good conduct has commended itself to the managers of the Institutions where they have been located; and in other ways assisting the Houseless and the Destitute.

FEMALE MISSION FUND.—For maintaining a Mission to the Fallen Women of the metropolis, and, as may be found practicable, of the country at large; to employ Female Missionaries to labour amongst them; to give donations with cases admitted to the Homes by their instrumentality; and to assist by Grants the Institutions established for the reception of this class.

Further information may be obtained by reference to the Publications of the Union, to be had on application to the Secretary.

A. O. CHARLES, Secretary.

Office of the Union, 118, Pall Mall, S.W.

BROWN and POLSON'S PATENT CORN FLOUR,

Preferred to the best Arrowroot.

Delicious in Puddings, Custards, Blancmange, Cake, &c., and especially suited to the delicacy of Children and Invalids.

The *Lancet* states—"This is superior to anything of the kind known."

Trade Mark and Recipes on each Packet, 4 and 16 ozs.

Obtain it where inferior articles are not substituted, from fam Grocers, Chemists, Confectioners, and Corn Dealers.

PAISLEY, DUBLIN,

77A, Market Street, Manchester, and 23, Ironmonger Lane, London.

METROPOLITAN FREE HOSPITAL, Devonshire Square, Bishopsgate, City, N.E.

PATRON.

H. R. H. THE PRINCE CONSORT, K.G., &c.

VICE-PATRON.

THE RIGHT HON. THE LORD MAYOR.

This Institution is continually open to the Sick Poor of every nation, without requiring a letter of recommendation. It is entirely dependent upon voluntary contributions for its support, and is urgently in want of Funds.

BANKERS: Messrs. BARNETT, HOARE, and CO, Lombard Street, E.C.

GEORGE CROXTON, *Secretary.*

ALARM GUN.—Capt. NORTON'S ALARM GUN, without vent or touch-hole, fired at the muzzle by friction, for protection against burglars, poachers, &c., is to be had of the London Gunmakers: Field, Blisset, and Beckwith, Holborn; Reily, New Oxford Street; Lang, Cockspur Street; Daw, Old Broad Street; and Wilkinson, Pall Mall.

MISS GEORGIANA COUVES, PIANISTE, (Organist at St. Saviour's Chelsea), late of Queen's College, where she obtained two First Class Certificates for Instrumental Music, Harmony and Composition, under the tuition of Dr. Sterndale Bennett, begs to announce that she will be happy to attend Private Families and Schools in any locality, within twelve miles of London, to give instruction on the Piano, Organ, and Composition. 35, Stanley-street, Ovington-square, Chelsea, S.W.

SPECTACLES—MICROSCOPES—TELESCOPES.—FINE STEEL FRAMES, with REAL PEBBLES, 7s. 6d. and 10s. 6d.; ditto, best Glasses, 5s. 6d., 4s. 6d., 3s. 6d.; Solid Gold, 20s.; Silver, 10s. 6d.

BERNARD DAVIS, 430, Euston Road, Regent's Park (close to Trinity Church), Optician to the Ophthalmic Institutions. Country residents can be accurately suited by stating age, &c. Enclose stamps, or P. O. order, payable Upper Baker Street, London.

MICROSCOPES, magnifying from 5,000 to 15,000 times, mahogany cases, 21s., 17s. 6d, 12s. 6d. Ditto, with all necessaries for every purpose, in upright Mahogany Cabinet, magnifying 60,000 times, £4 4s., warranted.

POCKET TELESCOPES, define ten miles, 10s. 6d.; ditto, 20 miles, 21s.

SMALL POCKET TELESCOPES, of immense power, and to show Jupiter's Moons, &c., by night, 60s.

MAGIC LANTERNS and SLIDES complete, 6s. 6d. 9s. 6d., 11s. 6d., 18s. 6d., 21s., 30s., up to 90s. Catalogues free for one stamp.

WHAT WILL THIS COST TO PRINT? is a thought often occurring to literary minds, public characters, and persons of benevolent intentions. An immediate answer to the inquiry may be obtained, on application to RICHARD BARRETT, 13, Mark Lane, London. R. B. is enabled to execute every description of PRINTING on very advantageous terms, his office being furnished with a large and choice assortment of Types, Steam Printing Machines, Hydraulic and other Presses, and every modern improvement in the Printing Art. A Specimen Book of Types, and information for authors, sent on application, by

RICHARD BARRETT, 13, MARK LANE, LONDON.

HOLLOWAY'S PILLS AND OINTMENT. — ALWAYS RIGHT.—A great and precious property possessed by Holloway's inestimable remedies is, that no skill or experience is required for their successful administration. No education or intelligence is necessary for using them with advantage beyond the capacity of understanding the plain and intelligible instructions for guidance accompanying each box and pot of the medicaments. For the cure of all internal and external ailments, Professor Holloway has beneficially placed such printed rules around his remedies that error is impossible after they have once been read with attention. In these Pills there is nothing nauseous to the taste, or trying to the most tender age or delicate constitution; in the Ointment nothing to annoy the most sensitive skin.

A GRATEFUL OFFERING.—A benevolent lady observing a few days ago the excellent style with which the Lytham lifeboat, on the Lancashire coast, was launched, decided on presenting to the National Lifeboat Institution 100*l.*, in testimony of her appreciation of the institution's philanthropic objects. During last winter the Lytham lifeboat was instrumental in gales of wind in saving life from the following wrecks:—Schooner E.D., of Salcombe, five men; brigantine Robert and Henry, of Dundalk, six men; brigantine Hannah Jane, of London, seven men; and from the brigantine Nancy, of Teignmouth, eight men and a boy, making twenty-seven persons rescued by this valuable lifeboat from a watery grave. The lifeboat had also put off and assisted in bringing safely into port two disabled vessels, with their valuable cargoes, besides having gone off once or twice in reply to signals of distress from ships. The neighbouring lifeboat at Fleetwood has also been during the present year the means of saving eleven persons during very heavy storms from the wrecked vessels Jane Roper, of Ulverstone; Ann Mitchell, of Montrose; and the Catharine, of Newry. The lifeboat was on each occasion, mostly in the night, in command of Inspecting-Commander Wasey, R.N., of the Coastguard, who for his intrepidity received the silver medal of the Royal National Lifeboat Institution, to which society the Fleetwood lifeboat belongs, and which was put by it on this important station about twelve months ago.

A GOOD FAMILY MEDICINE CHEST with a prudent use has saved many a life; and yet we think the idea might be improved upon, and reduced to a more simple form. Take some good compound, such as COCKLE'S ANTIBILIOUS PILLS, and we find that the desired end may be obtained without scales and weights, or little mysterious compartments and enchanted bottles with crystal stoppers. Others might be used, but Cockle's Pills, as tested by many thousands of persons, and found to answer their purpose so well, may be set down as the best.—Observer.

ROYAL NATIONAL LIFEBOAT INSTITUTION.

A MEETING of this institution was held on Thursday, September 6th, at its house, John-street, Adelphi, Sir Edward Perrot in the chair. There were also present, among others, Colonel Palmer, Mr. Lyall, M.P., and Captain de St. Croix. The minutes of the previous meeting having been read, a reward of 13*l.* was voted to the crew of the Lyme Regis lifeboat, which belongs to the Institution, for going off a distance of fifteen miles on the night of the 20th ult., during a gale of wind, and assisting, by putting some of her crew on board, to bring safely into port the schooner Ceres, of Shields, and her crew of five men. The lifeboat was reported to have behaved admirably, and to pull well on the occasion. A reward of 7*l.* 10s. was also voted to the crew of the Southport lifeboat, which has recently been brought into connection with the Institution, for putting off very early on the morning of the 26th ult., to the rescue of three men of the crew of the smack Hope, of Dublin, which during a heavy gale of wind was seen in distress on the Horse Bank, near Liverpool. The sea was making a complete breach at the time over the wreck, and the poor men who were in it had given themselves up for lost, as, owing to the darkness of the morning, they did not see the lifeboat until she was within 200 yards of them. The lifeboat on this station is old, and the National Lifeboat Institution has decided on replacing her with a new one. A reward of 4*l.* was given to a boat's crew for putting off and taking from the rigging, at considerable risk of life, the crew of two men of the sloop Britannia, of Preston, which during a gale of wind had sunk off Southport, on the 26th ult. The poor men had been in the rigging when rescued five hours, their vessel having sunk immediately after taking the ground. The thanks of the Institution, inscribed on vellum, were voted to Mr. Alexander Gould, captain pilot, at Aberdeen, in testimony of his valuable services in assisting with the Aberdeen lifeboat, and other means, in saving during the past two or three years the crews of several vessels which had been wrecked near Aberdeen. This lifeboat was built by Messrs. Forrestts on the plan of the Institution, and is kept in first-rate order. Various other rewards were also voted for saving life from wrecks. It was reported that the Institution had just sent new lifeboats to New Quay, in Cornwall, and to Banff, in Scotland. The cost of the former boat had been defrayed by a lady, and that of the latter by Messrs. Macfie and Sons, of Liverpool. A free conveyance had also as usual been readily given by the several railway companies to the two lifeboats and carriages. Lifeboats were ordered to be built for Penarth, on the Glamorganshire coast, and for Selsea, on the Sussex coast. It was reported that some benevolent ladies had presented 200*l.* to the Institution to enable it to plant a lifeboat at Llandudno, near Liverpool, in memory of a departed relative. A letter was read from Mr. Ferguson, harbour-master, of Victoria, Australia, of the 20th of June last, expressing his thanks for the various papers the Institution had forwarded to him, and stating that, in addition to the five lifeboats built on the plan of the National Lifeboat Institution, they were desirous to build some single-banked boats on the same principle, a drawing of which he requested might be sent to him. A communication was also read from Mr. Woodbridge, swimming-master at the lake in Victoria-park, stating that he had within the past few weeks been instrumental in restoring three lads who were apparently dead from drowning by treating them according to the rules of the National Lifeboat Institution. The instructions are based on the principle of the late eminent physiologist, Dr. Marshall Hall. These facts, taken in connection with the important services which the lifeboats of the Institution are constantly rendering to shipwrecked crews, proclaim their own importance; and while the National Lifeboat Institution can hope to bestow boons of such value on suffering humanity it may expect to retain its hold, with God's blessing, on the esteem and gratitude of the community. The institution earnestly appeals to the public for assistance to enable it to meet the very heavy and continued expense on its large fleet of lifeboats, now numbering 106. Payments amounting to upwards of 900*l.* having been made on various lifeboat establishments, the proceedings closed.

REFORMATORY AND REFUGE UNION AT GLASGOW.

The Reformatory and Refuge Union was represented at the late meeting of the Social Science Association by Mr. Robert Hanbury, M.P., one of the Honorary Secretaries, and Mr. A. O. Charles, the Secretary. From the paper read by Mr. Hanbury on the Metropolitan Institutions we select extracts, and from that by Mr. Charles, the first portion on the origin of the Union. The paper on the Mission to the Fallen is given in full in another page of this journal; that subject being usually omitted from the transactions of the Association.

Facts and Statistics respecting the London Reformatories, Refuges, Industrial Schools, and Penitentiaries.

By Robert Hanbury, M.P.—On looking through the list of the various Metropolitan Institutions, I find that out of seventy-one, five alone come under the head of Certified Reformatories, ten as Certified Industrial Schools, while the remainder, fifty-six, are almost entirely supported by voluntary efforts. The observations which follow in this paper may, therefore, be considered to relate more to Preventive Institutions than to those of a more penal nature. An evident improvement has taken place in the London Institution during the last seven years, and this may be attributed to the progress which has been made in the reformatory movement generally throughout the country, and also to the increased interest which has been bestowed upon such efforts.

During the last year there was expended on these Institutions 80,705*l.* This amount was derived from the following sources:—

Voluntary Contributions	£54,527
Payments by Inmates	3,189
Industrial work	11,882
Sundries, chiefly dividends on stock and interest	2,108
Government grants	7,314
County rate (Feltham School)	1,685
Total	80,705

It will be noticed that the sums received from Government are not more than one eighth of the voluntary contributions. The new regulations of the Committee of Council will materially reduce even this amount.

The receipts and expenditure given above are on account of 71 Institutions.

There are

For Boys:	Certified Reformatories	4	
	Certified Industrial Schools	3	
	Refuges and uncertified Industrial Schools	12	19
For Girls:	Certified Reformatory	1	
	Certified Industrial Schools	7	
	Refuges and uncertified Industrial Schools	14	22
Night Refuges for both sexes		6	
Penitentiaries and Homes for females.		24	30
			71

These Institutions can accommodate

Boys	1,626
Girls	863
Night Refuges	1,085
Penitentiaries	1,080
	4,654

During the year, in addition to the inmates already in the Institutions, there were received as new cases

Boys	962
Girls	632
Penitentiaries	1,307 *
	2,901

Night Refuges (different persons) 10,152.

These numbers do not represent all who were anxious to be admitted. One refuge for boys had 130 applications, and admitted 76; another had 148 applications, and admitted 82.

Four of the Night Refuges, accommodating 290, are open all the year. Two, accommodating 795, are only open during the winter.

These returns do not include the "Shoeblack Societies," except so far as the Refuges attached to two of them are concerned.

There are nine of these societies. They employ 319 boys.

Their earnings during the year were £4,548.

From the returns it appears that only a *few* of those admitted are orphans; *many* have lost their father, *very many* are driven to the streets and to seek shelter through bad home influence (drunkenness, cruelty, &c.).

The great fear with regard to Refuges and other Institutions of a voluntary character is that the wrong class should be admitted, and that parents and friends should cast off their children in order that they may be provided for elsewhere. To prevent this being the case, it has been found absolutely necessary, where practicable, to enforce a weekly payment, and in many cases this test has worked most beneficially.

As the inmates of these Institutions are not under legal detention, difficulty is often experienced in keeping them from absconding. In one of the largest Refuges we find there have been eight runaways during the past year out of a hundred inmates; but it is satisfactory to observe that while one of these had been in the Refuge for a year, four had only been inmates for a few days. I may remark that this Refuge, as well as most of our Metropolitan Institutions of a similar character, is carried on with the view not merely of rescuing those committed to their charge from a life of destitution, degradation, and suffering here; but by instilling into their minds the saving truths of the Gospel of Christ, of leading them to that life which is to come. Sure I am that it is absolutely vain and useless to attempt permanently to benefit the criminal classes, unless the opportunity thus afforded be availed of, to train them by direct Christian instruction. If this course be not pursued, however outwardly improved the case may become, havng nothing to fall back upon, a re-action is sure to follow, and it may be that the last state of the child is worse than the first. No. We must fill the mind of the child with the love of God, as shown so eminently by the death of his Son, who came to seek and to save. The Bible must be the basis upon which we build all our teaching, and by prayer that the Holy Spirit may guide as well as bless our efforts. Then, and then alone, can any real success be expected to be granted to our plans and operations. Such, in my opinion, should be the main principles of all Education, and I have no faith in any other.

The Origin and Proceedings of the Reformatory and Refuge Union.

By A. O. Charles, Secretary.

I.—The Origin.

The origin of the Reformatory and Refuge Union is to be traced back, primarily, to the Conferences held at Birmingham in 1851 and 1853. Those Conferences were convened from a conviction "that some effectual means ought to be adopted, in order to stem the tide of juvenile depravity," and that these means were to be found in the establishment of Preventive and Reformatory Schools. The interest excited by the first Conference led to the establishment of several Reformatories and the development of those already instituted. The attention of the Government was called to the necessity for some legislative enactments for the maintenance or assistance of these schools; but as yet no action was taken. Meanwhile, other agencies of a preventive character were also multiplied, and Refuges and Industrial Ragged Schools were formed in the Metropolis and several provincial towns.

At the second Conference, "the additional experience and more matured convictions which had in the interval been acquired, were collected, compared, and recorded;" and as the result of fresh agitation, coupled with the opinion ex-

* Owing to the insertion of the Address and Programme of the Social Science Meeting in Glasgow, these Reports were omitted last month.

* The total number of cases received by the different Penitentiaries since their establishment is 26,250. It is difficult to obtain a similar return for the other Institutions.

Digitized by Google

pressed by a Select Committee of the House of Commons, the Youthful Offenders Acts, for England and Scotland, became law during the next Session of Parliament.

After another interval, during which fresh schools were established, a third Conference was held of the managers of Reformatories and Refuges—this time in London—out of which, directly, sprang the Reformatory and Refuge Union. The Conference, however, was called with a somewhat different object in view, for the movement had assumed a new phase. It was no longer a question how far it was right and necessary to establish such schools, but how, when established, they were to be efficiently conducted; what was to be their practical working, and how might they attain the most satisfactory results. It was also found necessary "to consider to what extent, and in what manner, voluntary efforts might co-operate with the Government in the care of destitute children, and the reform of those who are termed criminals." It was further desired "to insure for the future a means of communication with the Government and the Legislature," and to "recommend such alterations in the law as might obviate the difficulties which retarded the effective co-operation of private institutions with the State."

These points, and many others arising out of them, formed the subject of discussion at the London Conference in March, 1855, when a committee was constituted "for receiving and disseminating information, and for communicating with the Government;" being empowered "to summon another Conference when advisable." One of the first acts of this Committee, in accordance with a resolution passed at the Conference, was the presentation of a memorial to the Home Secretary, representing the earnest desire of the managers of various Institutions that her Majesty would be pleased to direct that some one might be specially appointed for the sole inspection of Reformatories throughout the kingdom, who might be styled her Majesty's Inspector of Reformatory Schools. "The earnest attention of the Committee was given to urge forward legislative improvements of the Youthful Offenders Act, to remove the restrictions to the admission of boys out of Reformatories into the navy, and to the general diffusion of information. These efforts were successful. The Act was amended, and provision was made for the recovery of payments on the part of parents."

"The question, however, had so thoroughly laid hold of the public mind, and the number of institutions so rapidly increased, that the Committee felt the necessity of a larger and more permanent organisation to assist in giving a right direction to the movement." Accordingly, a fourth Conference was convened in February, 1856, when it was resolved "That an Association be formed, to be called the Reformatory and Refuge Union, as a centre of information and encouragement for Reformatories, Refuges, Industrial Schools, and other similar institutions for the prevention of juvenile crime, or the reformation of criminals in Great Britain and Ireland." An influential Committee was appointed, and they immediately took steps to raise a fund for the assistance of the Metropolitan Reformatories and Refuges, which, as voluntary institutions, received no assistance under the Act which had been obtained. A meeting at the Mansion House, presided over by the Lord Mayor, greatly assisted in raising this fund, which was distributed at a subsequent meeting at Willis's Rooms, when arrangements were made for an exhibition of the industrial work of the inmates of Reformatories and Refuges in the United Kingdom. This exhibition was in every respect successful. It was attended by his Royal Highness the Prince Consort, and many of the nobility; and coupled with the Mansion House meeting, showed the value and secured the permanence of the Reformatory and Refuge Union.

SUNDAY CAB-DRIVING.

A PUBLIC meeting, in connection with the London Cabmen's Sunday Rest Association, the object of which, as expressed in the programme, is to secure to the metropolitan cabmen "their natural and Scriptural right to the rest of the Lord's Day," was held in the large reading-room of the Workmen's Institute, York-road, Lambeth, Mr. J. Gurney Hoare, who takes an active part in promoting the views of the association, acting as chairman. Dr. Cay, of the Coldstream Guards, Captain Anstruther, of the Coldstream Guards, Mr. Rivington, Mr. J. Girdlestone, Mr. Charles Bird, and other gentlemen who interest themselves in its proceedings, were present, as were several ladies, but most of the people in attendance were cab-drivers and cab-proprietors. Mr. Girdlestone read the report, which, after a reference to the circumstances under which the association originated, in October, 1857, related in some detail its operations during the last fifteen months. It stated that by the kindness of Mr. John Henderson, of Glasgow, Mr. Arthur Kinnaird, M.P., Mr. George Moore, of Cheapside, and the Rev. John Mackenzie, of Edinburgh, the committee had been enabled, to offer prizes of 20*l.*, 10*l.*, 5*l.*, and 3*l.*, for the best essays on "Sunday Cab-driving; its influence on the physical, intellectual, religious, and domestic condition of the employed;" the competition to be open to cab, car, and fly-drivers of the United Kingdom. Twelve essays were sent in, and Lord H. Cholmondeley and Mr. John Macgregor, the adjudicators, had awarded the first prize of 20*l.* to John Cockrann, 7, Westmorland-street, Marylebone; the second, of 10*l.*, to A. Dickson, 7A, William-street, Edinburgh; the third, of 5*l.*, to G. Jones, 17, Jubilee-street, Bermondsey-place, Liverpool; and the fourth of 3*l.*, with 1*l.* added, to be divided between John F. Cheesman, 7, Marlborough-square, Chelsea, and Eadie Nimmo, of 395, Parliamentary-road, Glasgow. They mentioned the essay by John Bruce, of Buchanan-street, Glasgow, as next in merit. The report went on to state that there is a good law in London which provides that cabs may be licensed to run on the six working days only, in which case a seventh part of the license duty is avoided. The 6-day cabs are numbered 10,000 and upwards. There had been, since 1854, a steady increase in the number of 6-day licenses. In 1854 the number of such licenses was 570: in 1855, 675; in 1856, 774; in 1857, 908; in 1858, 1,100; in 1859, 1,240; and in 1850, 1,465. It also cited instances of the benefit to cabmasters from keeping their yards closed on Sundays. The missionary employed by the association—himself a cabman at one time—reported that a frequent observation to him by cabmen was, that if it was not for the religious people who hired them to ride to church and chapel, they need never appear on the ranks on Sundays. (A laugh.) The drivers, he added, complained most of popular preachers—(a laugh)—who attracted people to hear them from great distances. As many persons were employed to carry worshippers from Bayswater to hear a popular preacher four miles off as there were to convey persons to any six churches or chapels in the immediate neighbourhood. (A laugh.) A cab-attendant at a stand in Tyburnia, in a recent conversation with one of the committee, said there were more cabs went from there between 10 and 11 on a Sunday than on any other portion of it; adding that the public had no idea of the miserable condition of the men, and the utter want of self-respect which the practice produced among them. An incident was quoted by the missionary to show the strong feeling which existed among cabmen. A lady who had a first-rate establishment, and kept a powdered footman, used to engage a cab every Sunday when the weather was wet or the roads dirty. She always paid sixpence beforehand to the driver to take her to Marylebone Church, just within a mile. (A laugh.) The sixpence used to be sometimes accompanied with a religious tract, given to the driver, and occasionally one to the attendant on the cab rank. One day she gave a tract to the attendant which bore on Sabbath observance, and when she had gone he said to a friend "I respect religion, but such a development as this I detest," and he tore up the tract. The missionary also stated that the cabmen did not feel half so much carrying about people to places of amusement and dissipation, for they knew that such people did not pretend to have any particular regard for their neighbours, but they thought it dishonest in professors of religion to employ them on Sundays. The chairman, Mr. Hoare, in a good-natured speech, expressed the cordial sympathy he felt for cabmen in connection with their unhappy position on Sundays. They were a much abused class; but whenever he had an opportunity he took occasion to hint that it was perhaps not altogether their fault that they were the objects of so much obloquy. He wanted them all, he said, to become Christian gentlemen, and every one of them might be that, if he chose, even in their humble sphere. Mr. Hoare afterwards distributed the prizes to such of the winners as resided in London—namely, Cockrann and Cheesman. On handing the 20*l.* to Cockrann—a young man about 25—he mentioned, to his credit, that he maintained his aged mother; and Mrs. Hoare, who was present, presented Mrs. Cockrann and the daughter

Digitized by Google

of Cheesman each with a bouquet of flowers. The object of the association was afterwards advocated in speeches by Dr. Cay and Mr. Rivington, and also by several cabmen, who dwelt with homely pathos upon the moral, physical, and domestic evils which resulted to them from being, unlike almost every other class of the community, denied a weekly day of rest, and all opportunity for religious instruction and worship. They commented also upon the cruelty to which the animals they drove were subjected under so unnatural a state of things, and charged "the religious public" with being at the bottom of the evil. Mr. Emmett, of Waterloo-road, who was a cab proprietor for seventeen years, stated that he never plied a cab during the whole of that time on a Sunday, and he bore testimony from his own experience to the beneficial effects alike to masters, men, and horses, from resting on that day. He strongly urged the drivers as a class to abandon the habit of drinking and smoking, but especially drinking—advice to which the meeting responded by a cheer. George Barnes, another driver, attributed the unhappy condition of his class to the avaricious spirit of the masters, of whom they were the slaves, and spoke to the comfort he had enjoyed during the last three years in which he had ceased driving on Sundays. Cockrann, the cabman to whom the 20*l.* was awarded for the best essay, bore testimony to the improvement in his own fortunes by abstaining during five years from driving on Sundays, and, adverting to his prize-essay, he said it consisted of 19,000 words, and he wrote it all on the top of his cab in the open air. The rest of the cabmen who spoke were Cox, Channer, Cheesman, and Gray. The meeting terminated with a vote of thanks to the chairman.

NATIONAL EDUCATION IN IRELAND.

The report of the Commissioners of National Education in Ireland — their twenty-sixth report—states that at the close of the year 1859 they had 5,496 schools in operation, and the average daily number of children in actual attendance in the year had been 269,203, an increase of 3,112 over the previous year. The average number of children on the school rolls was 519,175, and the total number whose names appeared on the rolls at any time during the entire year was 806,510. The Commissioners trained during the year 289 teachers, and had in their service at the end of the year 5,636 principal and assistant-teachers, but of these only 2,791 had been trained. 83·9 per cent. of the children are Roman Catholics, only 5·1 per cent. belonging to the Established Church, 10·5 Presbyterians. Of the Protestant children about 18 per cent. attend schools where the teachers are exclusively Catholics; of the Catholic scholars 3¼ per cent. attend schools where the teachers are exclusively Protestant. The Commissioners direct their inspectors, in any cases where they find the children of one faith receiving religious instruction from teachers of another faith, to use their utmost vigilance to discover whether any compulsion or inducement, contrary to the fundamental rule on this subject, has been used to cause those children to be present at such religious instruction. But there really appears to be no proselytising going on. The head inspector, who reports on the Clonmel "model school," mentions that all the young persons of different creeds trained in it from its opening, in 1849, have remained stedfast to their religious principles; most of them are now in charge of national schools under Roman Catholic clergymen, some have become nuns, others have been appointed to situations in Roman Catholic seminaries, one in the Catholic Bishop of Waterford's college. The condition of the elementary schools appears to be encouraging. It is stated that there is a gradual improvement going on, and that the desire for rudimentary education is very great among the lower classes, and is growing, and the number of useful teachers is increasing. Mr. Vere Foster has generously expended upwards of 2,000*l.* in the purchase of school apparatus, which he has distributed among 785 schools. The demand for the labour of even children causes great irregularity of attendance, and the inspector, revisiting a school after the lapse of four or five months, may find half the children he left there are absent or gone. The reports of the proficiency in elementary knowledge vary greatly. Lessons in reading are very seldom given, and numbers of untrained teachers in rural districts never heard a good reader in their lives. It is stated that there is too much rote teaching, and "hard driving" to secure apparent proficiency without thorough grounding in elementary principles. Boys who can work all the exercises in the arithmetic-book fail in the practical questions of every-day market life, and are shamed by an uneducated countrywoman, who will solve them "upon her tongue." These are defects to be remedied, but they are not peculiar to Ireland; and we learn that the reading and writing are satisfactory, and the arithmetic is fairly taught in six of every ten schools. The girls are said to read better than the boys, but not to understand arithmetic so well. The children who are taught in the model schools get an education of a superior character, and in one of the ordinary national schools at Nenagh the inspector was rather surprised to find that the parish priest had introduced Latin and Greek; and they are taught in a very creditable manner, and without neglecting the more essential branches of education. The advanced class construed "Horace" very correctly, and on the inspector giving twenty-seven of them an improvised and difficult passage as an exercise in dictation, nineteen wrote it with ease and correctness. In this school, with a daily average attendance of only forty-one, the school fees for the year amounted to 100*l.*; but in the rural districts the amount received from the parents is small. The sums paid by the children in 1859 in aid of teachers' salaries, together with the local subscriptions, amounted to an average of only 3s. 3d. per pupil. There are a few industrial schools for girls, who devote part of the day to literary instruction and part to work, and thus earn wages and obtain an education at the same time; and there are 143 agricultural schools (including fifty-eight workhouse schools), besides the Albert Agricultural Training Institution and Model Farm, the inspector of which states that several agricultural colleges have recently been established in America upon a similar system of combining literary and agricultural instruction.

THE POST-OFFICE.

On Thursday evening, September 6, the sorters and letter-carriers connected with the Post-office, to the number of several hundreds, met in the Royal British Institution, City-road, to concert measures for obtaining a redress of their grievances—overwork and bad pay. Mr. Richmond, the chairman, said he had every reason to believe that the late Commissioners had recommended both a diminution of labour and a higher scale of wages. He was informed, however, that their report was to be laid aside for the present, and certainly its publication had been unaccountably delayed. Meanwhile the committee appointed at a former meeting were of opinion that an appeal should be made to Lord Stanley, the new Postmaster-General, with the intention, in case of failure, of petitioning the House of Commons next session for a Parliamentary inquiry. Mr. W. King accordingly proposed the adoption of a memorial to Lord Stanley, urging the early production of the report of the Commissioners and the carrying out of its recommendations. The motion was seconded by Mr. Lee and supported by Mr. Rosoman and other speakers, who described the position of the letter-carriers as one of poverty, misery, and degradation. It was stated, as a proof that the men were overworked and underpaid, that there was more than an average amount of illness in the Post-office, chiefly weakness produced by want, and that the principal medicines prescribed by the departmental doctors were codliver oil and quinine. Bitter complaints were made that, while nothing had been done to improve the condition of the letter-carriers, the salaries of the assistant secretaries and other high officials had recently been increased. The conduct of the Government in delaying to publish the report of the Commissioners, and to act upon its suggestions, was vigorously denounced; and a strong determination was expressed, should the appeal to Lord Stanley be unsuccessful, to solicit the intervention of the House of Commons. Eventually the memorial was agreed to unanimously, and the proceedings terminated with a vote of thanks to Sir G. Bowyer and the Press.

REFORMATORY FOR JUVENILE CRIMINALS, REDHILL.

A GENERAL court of the governors of this institution was held September 5th, at the London Tavern, Mr. C. White in the chair. Mr. Rogers (the secretary) having read the advertisement in *The Times* convening the meeting, the minutes of the last general court were read and confirmed. It appeared from the report of the auditors that the receipts for the last quarter were 2,700*l.* 16s. 6d., and the expenditure 1,943*l.* 12s. 6d., leaving a balance in favour of the institution of 757*l.* 4s. The report of the secretary for the quarter ending August 31 stated that the number of admissions for the last three months had been twenty-nine—viz., nine from Surrey, four from Kent, one from East Sussex, three from the city of London, three from Somersetshire, one from Brighton, one from the borough and one from the county of Nottingham, one from Bath, one from the Thames Police-court, one from the Clerkenwell Police-court, one from Shropshire, one on payment by friends, and one re-admitted who had been previously discharged. Under the head of discharged six had emigrated—viz., four to Sydney and two to Adelaide, New South Wales; five were restored to their friends, one enlisted in the army, two were on licence to work, three had been committed to prison for offences in the reformatory, and one had died; making a total of eighteen. The number of boys in the institution on the 31st August was 262, or eleven more than in the quarter ending May 31. It was announced that during the last quarter a donation of 100*l.* had been made to the funds of the institution. A vote of thanks was passed to Mr. Moxon, the auditor, and Mr. Rogers, the secretary, for their attention to the interests of the society, and, some business of a formal nature having been transacted, the proceedings concluded with the usual compliment to the chairman.

THE PROGRESS OF VACCINATION.—On the 14th of May, 1796, Jenner vaccinated a boy named Phipps, eight years old, from the hand of a dairywoman who had the true cowpock; the boy went well through the experiment, was inocculated for smallpox in July, and failed to take it. From this time forward it was the custom to make the 14th of May a day of rejoicing in Prussia and elsewhere, and to publish the annual results of vaccination. For many years the vaccinations exceeded the births, showing that the people were aware of their danger while any remained unsecured. In Prussia the deaths from smallpox had averaged 40,000 annually before vaccination was introduced; and within twenty years they had sunk to 3,000, though there had been a large accession of new territory. Sweden and Denmark, and some territories in Germany, remained absolutely free from smallpox for twenty years after the practice of vaccination had been properly adopted—a sudden change from the few preceding years, when 600,000 persons died annually of smallpox in the world at large, and 210,000 in Europe; and when every quarter of a century saw 25,000,000 of human beings carried off by the foulest of distempers.—*Once a Week.*

Notices to Correspondents.

The Editor requests that any circumstances connected with Charitable Institutions, which it may be thought advisable to bring before the public, may be communicated to him at 337, Strand, on or before the 14th of each month.

NOTICE.

It is requested that Reports of Meetings Pamphlets, Reviews, or other matter communicated for the benefit or notice of "The Philanthropist" may be forwarded, if possible, to the Editor, on or before the 14th of the month, that they may have the attention to be desired.

Notice.—Subscribers of £1 1s. and upwards to the Reformatory and Refuge Union, 118, Pall Mall, will be supplied on application with "The Philanthropist," a Monthly Journal of Social Economy.

SOCIAL SCIENCE GAZETTE,

November 1, 1860.

SOCIAL SCIENCE.—V.

THE causes and prevention of Crime, which are correlative subjects—for the removal of the active cause of any evil is the obvious means of preventing its continuance—ought to cover the whole field of inquiry undertaken by the Third Department of the National Association. The treatment of criminals under sentence, whether adult or juvenile, is a subordinate head, as one of the chief causes of crime has been, and to a considerable extent still is, the inefficient and unreasoning method of punishment. Until very recent times nearly every one who wrote on the provisions of our penal law, whether as the advocate of a deterrent severity, or as a prison philanthropist, seems to have overlooked the fact that nothing done *inside* the gaol would be of avail when the prisoner went *outside*, if he had not been brought into such a frame both of body and mind, and were so instructed and circumstanced as to be capable, and be given the opportunity, of earning an honest livelihood. As long as this fact, now admitted as true, though not always recognised in practice, remained nearly unnoticed, it is no wonder that so large a proportion of prisoners were cases of recommittal.

But there is, no doubt, much difference to be observed in dealing with the general causes of crime, and those specific causes which have directly and obviously influenced the conduct of individual criminals—such as intemperance, temptation, habits of vice, or (as already observed) imperfect or injudicious treatment on conviction. Such as these can for the most part be pretty accurately defined in each case, or each class of cases, and the appropriate remedy applied; and it is to the elucidation of these remedies, and their mode of application, that the department of Punishment and Reformation has to devote itself. The more general causes of crime, unquestionable and potent as they are—such as hereditary predisposition, dense population, bad habitations, ignorance, and poverty—do not come within the proper sphere of criminal reformers. Such social conditions are the root of much other misery; crime is only one of the incidents, and not the most prominent, flowing from them; and they must be dealt with on a separate basis, as a part of our general social economies.

Of all the specific causes of crime, intemperance is, beyond doubt, the most frequent. This fact has been attested by judges of the greatest experience, by gaol chaplains, and by prisoners themselves, who generally impute their first lapse into crime, or their subsequent continuance in vicious courses, to the evil influence of drink. As there are upwards of 100,000 drinking-houses in England and Wales, a number double that of shops for the sale of meat and bread, and, consequently, far beyond the natural requirements of the population, it is evident that an active cause of crime is constantly at work, undoing all that the agencies of religion and education can effect, and furnishing recruits for lawlessness and immorality. Whether it is possible to diminish this national curse by any active intervention, or whether we must trust to advancing civilisation to work the same cure in the lower ranks as it has already effected in the higher, is a question on which it is not now necessary to enter. Suffice to say that all who have looked carefully into criminal statistics hold it as indisputable that without a diminution of intemperance it is idle to hope for any considerable decrease of crime.

Another fruitful source of dishonesty,

Digitized by Google

—especially of that casual thieving which is quite distinct from the practices of habitual rogues, though unhappily treated too similarly by the law,—is the amount of temptation held out in various ways to the ignorant and poor. The careless exposure of money and goods easily to be taken is an offence against sound morality, too often committed and judged far too lightly. In some cases the expenses of prosecutors who have been robbed through their own negligence in this respect have been disallowed at the trial, but it is to be feared that a much more uniform and severe repression of this common encouragement to crime is needed before any sensible effect can be produced on its frequency. Occasionally, indeed, the peculiar trade of a locality is found to do much, and, perhaps, unavoidable mischief in this way; as, for instance, the abundance of coal loosely stacked by the wayside in a mining district, offering almost irresistible inducements to pilfering; or the bales of cotton lying on the quays at Liverpool, from which so many handfuls are plucked that the receiving and sale of them are a regular branch of trade to a dishonest class in the town. It is stated by Mr. Carter, the chaplain of the Liverpool Borough Gaol, that this cotton-stealing is greatly promoted by the marine store-dealers, who supply ready facilities for disposing of the stolen property, and it may be easily imagined that this class of receivers do not restrict their business to cotton alone. Yet in Liverpool, and other seaport towns, marine store dealers are under some sort of regulation, and therefore it may be presumed are to a certain extent restrained from dishonesty; whereas in our inland towns they can only be punished, like other guilty receivers of stolen goods, by means of an indictment, under which a conviction is difficult. The Chamber of Commerce of Birmingham have prepared a Bill to arrest this evil, and we may hope that it will pass into law in the next Session of Parliament. It is in our large towns that habitual criminals are bred and trained. Orphans, illegitimate children, and the offspring of thieves and prostitutes, are the raw material out of which the manufacture of lawlessness goes on. In a social condition like ours, where luxury and poverty are both common—where profligacy is only too rife among the wealthy, and reverses of fortune are frequent, where property of dazzling value is abundant, and a dense population in a measure defies the most searching efforts of religious and moral instruction, it is to be feared that a class of children will always exist ready to fall a prey to professional thieves. Industrial schools, ragged schools, shoe-black brigades, and other similar institutions, seem the practical weapons for combating the evil; and a general extension of their operation, with a more hearty assistance from the magistracy and police than is now always given, would probably reduce the supply of young habitual criminals to a very low ebb. With those that must still remain, our Reformatory schools would deal efficiently.

These last-named institutions are now so well known, and their success in the repression of crime, as well as in the reformation of individual offenders, is so unquestioned, that it is unnecessary to speak of them further, especially in the pages of the *Philanthropist;* but a few words on another and different, but yet kindred, class of schools will not be out of place. The Certified Industrial Schools, which were sanctioned by the Act passed for that purpose, in order to deal with a class of children younger in the ways of evil than those for whom the Reformatories were designed, and requiring prevention rather than cure, have not yet flourished as they ought to have done. They are really quite as important, and likely to do as much good in their way as Reformatory Schools, and it is most unfortunate that any prejudice or misconception should exist concerning them. Some of the metropolitan magistrates, it is said, have an opinion that the words of the Act are not sufficiently distinct; and that it is impossible to convict a child for what is termed in one of its clauses an "act of vagrancy." In the Transactions of the Social Science Association for 1859 (page 534), there is a letter from Mr. Hall, a high authority among police magistrates, distinctly negativing this objection; and as there is no real ground for it, either in the construction of the Act, or in the general law of the land, it will doubtless be removed by argument and perseverance. The Act has been worked successfully in Bristol, as was shown by Dr. Beddoe's interesting paper, read at the Glasgow meeting; it is being gradually pushed into practical operation in the metropolis and other large towns; as schools spring up the right men will be found to manage them, and in a few years the triumph of the Industrial School plan will be as decided and acknowledged as that of the Reformatory is now.

Although it is the general opinion of persons competent to judge that crime as a whole has decreased and is decreasing in this country, it must be admitted that the treatment of adult criminals is not on a par, as respects its efficiency and results, with that of juvenile offenders. It is not the system of prison discipline which is so much at fault, as it is the old error on the bench, and in the Home Office, that when a certain amount of punishment has been meted out for a certain offence, the ends of criminal justice have been answerered. Hence the short imprisonments, which do nothing but make the convict acquainted with prison life, and angry at restraint. Hence the sudden dismissal from gaol at the expiry of the sentence, and the consequent, the natural, and almost inevitable relapse into crime. Now the real object of criminal jurisprudence is the protection of society against crime; and when once a man has offended against the law, this object can only be accomplished in one of two ways; either absolutely incapacitating him for further offence by the infliction of death or perpetual imprisonment, or else effecting such a change in his habits and disposition that henceforth he will live as a good citizen. The moral sense of society will not permit the adoption of the first alternative except in extreme cases, and it should, therefore, be held necessary to effect, whenever possible, a thorough and permanent reformation of the offender; first, by a sentence of imprisonment of such duration as may afford ample time for the proper authorities to deal with him; secondly, by such a system of reformatory discipline as may improve and instruct as well as punish him; thirdly, by gradually and judiciously accustoming him to freedom at the end of his sentence, by means of a probation which will at once test his sincerity and assist his endeavours after virtue. The papers of Mr. Baker, Mr. Shepherd, and Mr. Eddy, in the transactions of 1859, afford many valuable suggestions on this subject. The successful system of Captain Crofton is too well known to need observation.

W. G. Hastings.

REFORMATORY DEPARTMENT OF THE GLASGOW MEETING.

The opening address to this department of the Social Science Congress, given by the Hon. A. F. Kinnaird, on the relation that subsists between punishment and reformation, leads—as all practical consideration of the subject must lead—from the extent of crime to be punished, to the causes of crime to be prevented and reformed.

The nature of these causes none can deny or ignore; but their reformation, even when acknowledged and deplored, is so complicated and difficult a question, that

Digitized by Google

the experiences and conclusions of all honest lovers of their neigbour need to be collected and compared to enable the good to make any united social stand against the bad, or organise any effective social mission amongst them.

This collecting and comparing is the essential service to the Reformatory movement which the Social Science Association renders; and each year's Congress throws fresh light upon a subject which, with all its painfulness, has one hopeful side—the children who may yet be saved.

Mr. Kinnaird has ably placed these causes in review before the Congress, and his statements lead us to the division of causes into three heads.

1st. What can be controlled by Legislative authority, such as Sanitary Acts, Lodging-house Acts, Gin-shop Licenses, and Ragged School Provisions.

2nd. What can be controlled by social authority, such as the conscientious fulfilment of the relations of landlord to tenant, teacher to pupil, master to workman, mistress to servant, or, in one word, Christian neighbour to his neighbour.

3rd. What cannot be controlled at all, the awful right of the individual to choose how he will live—the human right to keep his body and soul as diseased as he will, so long as his doing so injures none but himself.

The more these three causes of crime act upon each other, and the more necessary the co-operation of law, society, and individual, may be to make any real progress in Reformatory work, the more necessary it is for each to do its utmost. If a law may be but a dead letter unless the society legislated for accept and obey it, the more need for legislators to enact what commends itself to social appreciation, and supplies social needs.

If social authority cannot coerce the masses without Legislative support, the more need for such influence, as it has to be exerted to the utmost, and by showing what it can do, demand legal help for what it cannot enforce.

If the individual be to a certain extent uncontrollable by law or society, the more must both do to confine the evil of his misdoing to his own personal loss and suffering. And if to every individual it be hard to do well under an evil system of law or society, the more every individual needs to make himself an element of good in the social system for whose wants the laws are framed.

Mr. Kinnaird dwells forcibly on the inevitable vice engendered in the "festering and grim rookeries" where human creatures swarm as unconscious of their moral needs as they are reckless in gratifying such physical ones as they are sensible of. Any one who knows anything of the opinions or feelings of the poor in low districts of crowded towns, must have observed their unconsciousness of how depraved they are. They may know murder is murder and theft is theft, but of their filthiness, their rudeness, their lying, their uncleanness, they have no standard by which to judge; no light to see how they look. Classes cling together, and all classes shrink away from those immediately below them. When the honest shrink from the dishonest, the pure from the impure, the civilized from the brutal, the instinct is in itself natural and lawful; but when the rich shrink from the poor, and let poverty fester into disease and crime, we feel disposed to look upon these outcast masses as upon deserted or perverted children, and blame them less than the parent-state and the upper ten thousand of her more favoured children.

This state of things none are labouring to remedy more earnestly than the highest classes in the land. Mr. Kinnaird enumerates much that has been done by the Legislature to reach the evils of over crowding, Lord Shaftesbury's Lodging-Houses Act more especially; and suggests further measures against another fruitful, perhaps *the* most fruitful, consequence and cause of abject poverty.

"One immediate and gigantic evil springing out of the utter comfortlessness and want of home attraction existing in these over crowded districts is the great demand that naturally arises for the petty and ill-conducted beer-shops which superabound. (Hear, hear.) The misery of a home makes a wretchedness of heart that is always longing for excitement. Something ought to be done to abate the evil of these houses; their number ought to be lessened, the regulations under which they are licensed made more stringent, and the power to suppress them in cases of complaint made more vigorous and prompt. (Applause.) The poor man deserves at our hand some protection against the evils of these houses. I am not prepared to enter fully into details of what might be done. The Act known as the Forbes Mackenzie Act (but which was in reality conceived and originally framed out by my brother, (Lord Kinnaird) works well in Scotland. (Applause.) The Royal Commissioners appointed to inquire into its operation have reported in its favour. This is very important. Why may there not be some modification or adaptation of the provisions of this Act framed so as to be suitable for the requirements of England? (Hear, hear.) Of this I am certain, that could we remove the temptation of these ill-regulated beer-houses and gin-shops from the view and the reach of the labouring population and the poor of our large towns and cities, we should most materially diminish the inducements to the predisposing causes of much of the crime throughout the land."

But when all is done that law can do to restrain or prevent adult crime, the prospect of success is doubtful, when the habits of the man or woman are once formed. The education of the children springing up in this vitiated atmosphere seems the only sure ground for improvement. And here much remains for the Legislature to do, and more for social authorities and private philanthropists.

"The industrial training of the young is also a measure that deserves much more attention than it has yet obtained. Our national and parochial schools do not adequately supply the wants of our labouring classes and poor. They give, it is true, a fair amount of literary education, but they fail in industrial training. We have seen that home influence has much to do in checking crime; let us then prepare the boys and girls of our poor for home life. (Applause.) It would be much better to train the girls to manage a house, or to keep a room clean and tidy, and to make the most of the means of comfort which they, as working-men's wives, are likely to possess, than to perfect them in the knowledge of the water-shed of Europe, or the mountain-ranges of South America. (Applause.)

"I fear the Committee of Council on Education is not altogether free from blame in giving a wrong direction to the studies of the youth of our land. The Committee of Council never meant to unfit them for service, or for the performance of their home duties, but they have done so practically by giving them such a superficial amount of instruction on advanced subjects as brings with it the pride, not the humility of knowledge, and fosters tastes incompatible with their position in life. From this source springs much crime. The restless striving after other positions, other enjoyments, finer dress than that to which they are legitimately entitled as the daughters of working-men, who have to work for their own livelihood, leads directly to it. Our boys, too, why should they not learn some of the industrial arts while at school? Not that the trades are to be taught in the school instead of the workshop; but why should not every boy know enough of tailoring, of shoemaking, of carpentering, and other arts, as to enable him, when the father of a family, to make his children's shoes, although he may be a painter by trade—to make the easy-chair for his wife, even if he work during the day as a stone-mason—or to make or mend his own coat, although his ordinary calling may be that of a garden labourer or a porter? Training like this would create a taste for home occupations, and the father of a family being employed in his own house throws the greatest safe-guard round him and his family. And here I must remark that the treatment of the children in the unions and workhouses throughout the country is unsatisfactory. I believe that if the facts were ascertained accurately, it would be found that a great number of the children brought up in our workhouses become the youths of our reformatories and the men of our gaols. A modification

Digitized by Google

of the system pursued here is absolutely necessary." (Applause.)

The writers of other papers read before the meeting corroborate this statement, and one by Miss Hope imputes the inefficiency of the education to the most probable cause, the wrong training of the acting educators. Miss Hope states that the mistresses of girls' schools are inadequately and unequally prepared for their office, but it is equally true of the masters. It tells more obviously in the former because household arts are expected to flourish indigenously in women, and when it is proved that neither nature has implanted nor education engrafted these invaluable faculties, every one is more surprised and indignant than when a schoolmaster proves inefficient to teach gardening or tailoring.

There is no blame to be imputed to these teachers. The mistake is in the inequality between their intellectual and social training. The amount of study necessary to pass their examinations requires their whole energies. With no early apprenticeship to the difficulties of foreign languages, dead or living, such as gentlemen's children receive, they are expected to master the grammar of their own, the highest branches of arithmetic and the history and geography of places to which no home talk or general literature has familiarized their minds, and lightened the drudgery of facts and dates. They must know all this, and know it thoroughly—how thoroughly any one who has ever given a *viva voce* lesson to a class of sharp-witted, ill-mannered children will understand and appreciate. No wonder that when they have accomplished this they over estimate the work for its own sake, and feeling above their relations in life on one point fancy it incumbent on them to disdain them on others. We know of more than one girl who is high in acquirements, great at examinations and rich in certificates at a first-class training college, who when her books are closed speaks as bad grammar and shows as weak judgment as if she had never studied at all. The young men acquire a better manner of speech and address, and a more thorough education, from the greater freedom of their college life, and the personal influence and sympathy of the clergy and gentlemen in the diocese who superintend the college. But the best of them often desire a further change of social standing, and wish to take orders at home or in the colonies. We may respect such men's wishes; but what we desire to show is, that people in a *transition* state of mind cannot have that energy which accompanies the contented conviction that we have found our place and vocation, and have our whole heart in fulfilling it.

Either instructors required to suit the present standard of acquirement must be gentlemen and gentlewomen, above all elation or mortification about their position and its duties, or the standard of book-learning must be lowered and that of industrial capability raised. The latter seems the most obvious and practical course in the case of paid teachers, for the cause of manual labour needs every support it can receive. Ask a poor man "out of work" in a London alley what he can do, what is his trade? the majority will answer, "Oh, anything," which on inquiry proves to be nothing, that is nothing skilled or remunerative; the lowest work at gas-works, or navvie work under bricklayers, is the refuge of most of them.

If this want of industrial training be felt in the teaching of ordinary schools, where the children have decent homes and parents willing to advance their education, it is more urgent still in certified, reformatory, or workhouse schools.

Mr. Kynnersley's paper, read by Mr. Ware, on the Treatment of Juvenile Offenders by the Magistrates, and Miss Carpenter's on the Supplementary Measures needed by the Reformatories, show the difficulty of effectually reforming children beyond the period of their school detention. Industrial and moral training are the only sure grounds on which to start a child among the temptations of working life. The tree of human knowledge can of itself bear no good fruit; the cultivation of the intellect is a means not an end of education, and if teachers are to go forth to their scholars strained to their utmost power in mere brain-work—for we repeat that the plain English education that sounds so easy is to them a hard study—the chances are they go forth frayed and damaged in health and spirits to the conflicts of moral training, and disqualified manually and mentally to teach industrial arts.

INDUSTRIAL SCHOOLS FOR LADIES.

II.

The suggestion, previously quoted, made by H.M.'s Inspector of Schools, Mr. Norris, on the subject of Girls' Industrial Schools, was that one such school, purely industrial, and a mere training home for domestic service, should be established in each district of a given circuit, where children might be sent for that important branch of their education, instead of attempting to combine household labour with the reading, writing, summing, and sewing, for which their schooltime is generally short enough, too short in many cases.

In agricultural districts, where the village schools lie wide apart, such a scheme would entail serious expense, as schools in nearly the same proportion to the parishes, as are the new union workhouses, would require to be built. If this were done at public cost the rates would be heavily taxed, and the school placed under the same rank of mistress as a union matron or workhouse schoolmistress. Moreover, the old failure of all school-training for service would remain, plenty to learn and nothing to learn upon.

Private enterprise and benevolence is the best hope for increasing the number of these schools, which, as at Brockham, Reigate, and at the Red Lodge Cottage, Clifton, do already exist, though their number is a drop in the ocean of the demand for them. That a gentlewoman should head and guide such an institution is self-obvious, but that her assistants should be girls of her own station is a suggestion that to many minds will need explanation and defence. If girls from sixteen to seventeen, or seventeen to eighteen years of age, or at any age when childish irresponsibility has given way to the lawful wish to find a place and a value in the social scale, were placed at such a school, under such a superintendent to carry out her orders, and learn how their own should hereafter be given, we think the future generation of housekeepers would benefit as much as the future generation of servants.

But to begin with the class most needing help, and to take the essential point of finance first of all, the existence of such a class of paying pupils would materially lessen the expenses of the establishment. The sum paid by each for board and attendance would maintain at least one serving-pupil, whilst the residence of an upper class in the school-house would create the reality of work to be done, which has just been stated to be the failing point of household-training schools. Such an upper class, living much as they would live at home, would afford practice to the servant-pupils in those branches of domestic arts which they would otherwise have to acquire from the upper servants of the family they first enter; a school which undoes all that the training-school has in morals attempted to do. Cleaning out a schoolroom, a kitchen, or even a mistress's parlour, will not qualify a girl to clean and arrange the costly and intricate furniture of a modern drawing-room, or accustom her to handle delicate glass and china, or to render quiet and dexterous

Digitized by Google

personal attendance in illness, at table, or in any shape in which actual domestic service will call for it.

The benefits to the servant-pupils need no enlarging upon; the question is, what are to be the benefits to the young ladies themselves, and what they are to do and be in such a house besides make practice for the others?

To put them under the same manual training as the serving class is not proposed, excepting so far as to make them practical teachers of the duties they are to see executed, but to habituate them to receive and transmit orders much as a midshipman does, till by echoing a good commander he becomes in his turn fit to command. Good soldiers can do little under bad officers. It is useless to turn schoolgirl servants, accustomed to look to superiors in every detail, into a house where they can look to their mistress in none. Such is at present the case. We ask too much of a servant in our affected refinement. A groom of the chambers, and a *maitre d'hotel* may be very proper and efficient officers of a nobleman's household, and the old family butler and housekeeper of the last generation were, perhaps, fit guardians of the younger servants, but the race has died out, and the present system will never produce their like again. The ordinary run of servant is not fit to arrange and order her own duties to the extent modern manners assume that she is. Did any of our readers ever study the *Finchley Manuals?* Invaluable hand-books for helpless mistresses as they are, the conviction after reading them, and calling to mind the amount of judgment and reasoning faculty in some of the best specimens of servants, is, "no modern servant could carry out this: time would fail her single-handed, and courage if among her fellows." Undoubtedly the homes of our middle-classes need better ordering, as well as better serving.

This power to order is just what a few months in an Industrial School would give. It is one thing to be imperious on impulse and another to be authoritative on principle. To grudge money and materials when the money is our own, and to economise when the money is the community's, are as different principles of action as could be imagined, yet in private houses they are hopelessly confused. A girl who had learnt the true interpretation of *economy* in administering a general fund would have no imaginary difficulties in regulating her home expenses afterwards. Moreover, while ordering, the girl herself is under authority. No pettiness of will or temper, no injustice or slothfulness could be exhibited, and invalidate her authority with those under her; and the change of office each officer would make in learning all branches of household duty would prevent any undesirable combination between two differing classes of young people. The kitchen, the laundry, the household and table service, the accounts of the household, would each require a special charge, and in fulfilling the round no lady pupil would remain very long over one department of service, while the under girls would necessarily choose their branch of service, or have it prescribed to them, and remain in it to perfect themselves.

The advantages to the ladies themselves are such as would tell in their future homes as wives and mothers. We do not desire to dwell much upon any advantages to be derived from such a training to women who may never marry, for the opinion stated in a popular journal that such have "failed in business," makes a practical public dwell less on any benefit to single women than to those who are to impart those benefits to husbands and children.

But the bankrupts themselves may be allowed an interest in the matter, and to them we feel sure that the opening of a demand for lady housekeepers would be opening a sphere of usefulness apart from gain, though it might also be an honorable means of self-support. The claims of society and custom, the prejudices of a husband, the cares of very young children, might prevent many a married woman, after due training, from attending to detail. A well qualified substitute would be as valuable to her in her house as a well qualified governess to her children, while the position of a lady housekeeper would be far more independent and agreeable. Tenacity of position, or care about sharing the society of visitors, would be equally beneath both, if they knew their own duties and their own value; but certainly the balance of probability as to which inmate would have least temptation, or inclination to be *de trop* in the family circle, is in favour of anyone so cheerfully and actively employed as a thoroughly qualified housekeeper, the keeper or maintainer of order and comfort to and for every member of the household.

THE MISSION TO THE FALLEN.*

BY A. O. CHARLES.

SECRETARY OF THE REFORMATORY AND REFUGE UNION.

The mission to the Fallen Women of London, instituted by the Committee of the Reformatory and Refuge Union in the beginning of 1858, has been so far attended with success that it has been thought desirable to present some account of it on this occasion, with the view of stimulating to like exertions others in different parts of the kingdom who may feel interested in this unhappy class.

The mission was commenced at the time when public attention was being directed to the so-called "Great Social Evil." But it may be as well to state at the outset that it was not because it was regarded as a *social* as much as a *moral* evil that the efforts were put forth, and have been continued, which it is now proposed to describe. We feel more anxious about the moral and spiritual condition of those who are thus walking in the ways of sin, than we do about the loss of social position and domestic happiness, which are the present fruits of the evil. We have, therefore, from the commencement sought to lay before them the everlasting misery and ruin which they were bringing upon themselves by continuing in their course of sin; and we have not been careful to get received into homes those who were simply anxious to better their position in life. This is the groundwork of the mission; and to be really and lastingly beneficial, it must be the groundwork of all efforts for the reclamation of the fallen.

It may be interesting to describe the plans which are pursued by the missionaries. And first it should be explained that this is entirely a female agency. It has been felt that no efforts were likely to be so successful as those which were made by their own sex. They are able better to enter into their feelings, to sympathise with them, to receive from them their tale of sorrow, and to advise them for their present and eternal welfare.

As a rule, the missionaries leave their homes between nine and ten o'clock at night, remaining out till nearly twelve, and occasionally till one in the morning. They are located in different parts of London, near to the nightly walks and haunts of those they desire to benefit. They are not long before they find some with whom they may enter into conversation. Usually the offer of a tract is the first step; and it is remarkable, considering their class, how seldom the tracts are refused. Of course no rule can be laid down to determine the next step. The missionaries are guided solely by circumstances. Sometimes they are only able to exchange a few words, and are obliged to pass on, leaving the tract to produce its effect. At other times they are engaged in a lengthened conversation, with varying results. One of the missionaries lately spent nearly an hour in Regent-street, conversing with a most interesting girl of eighteen. She was deeply affected, but she evidently strove to resist her feelings. On the missionary inquiring if she liked the life, she replied, "Yes, occasionally." But by-and-bye, when she was asked—on hearing that her mother was dead—if she had been a praying mother, she could no longer restrain her emotion, but burst out crying. The missionary drew her aside, and with all earnestness besought her to look to the Saviour. She was much moved, but still would not relinquish her sin. All that could be wrung from her was a promise to go home and to

* Published by desire of the Reformatory and Refuge Union.

Digitized by Google

bend her knee in prayer, if she had not done so for years before, and to implore God for Christ's sake to have mercy on her. She added, "Yes, I shall go home. I could not stay out now. You have made me miserable."

Frequently these conversations have a different result, and here great caution and discretion are necessary. The prospect of a home is often an inducement to leave their life of sin only because it is more comfortable. Or they may be labouring under the excitement of the moment, and have no permanent convictions. Thus a girl was one night much affected; she cried, and clung to the missionary, and said she was very unhappy. The missionary promised to call on her in a few days. When she did so she was received very civilly, but the girl declared that she had been drinking a little the other night, which made her feel the wickedness of the life she was leading, and that now it was not quite convenient to give it up. Notwithstanding every exhortation, she still adhered to her sin.

Such cases being of frequent occurrence, the missionaries are obliged to exercise a sound discretion as to the course to be pursued with those who appear at the time disposed to give up their sinful life. Many are told to call the next morning, when, if still of the same mind, something should be done for them. At the same time there are many met with during the night who are sincerely anxious to reform, and for these it is desirable to have some immediate place of shelter to which they may be taken till more permanent provision is made for them. The missionaries have, therefore, a spare room in their own houses in which to accommodate such cases. Sometimes they are admitted to a home the next day; but occasionally it is thought well to test them for a few days before anything more is done. And the missionaries feel this provision to be most important for the successful prosecution of their work. Shelter is afforded at a critical time; and whether the result be satisfactory or not, the little money laid out has been well spent.

It will occasionally happen (especially when a missionary first engages in the work) that a tract may be offered to one for whom it is not intended. But a kind word even to such an one, met at that time, and under those circumstances, may be useful, and not out of place.

In addition to these nightly walks, much time is given during the day to visiting the hospitals and workhouses, where the fallen women are found in considerable numbers. Here, again, the tracts are most useful, and are frequently eagerly sought after. They will, under these circumstances, gladly listen to the missionary as she reads from the Word of God, and offers prayer on their behalf. Many have here been induced to resolve on quitting their life of sin; and, after being placed in homes, have become respectable and useful members of society.

The parks are also visited, and here the value of the mission as a *preventive* agency is apparent. Girls foolishly loiter about until they are entrapped and fall. The presence of a missionary has, by the blessing of God, in some cases prevented this. One of them relates that, being in St. James's Park, she observed a young woman nicely dressed sitting on a bench, and a man talking to her as if persuading her to go away with him. She went and sat between them. The man was enraged, and began to insult her. Bent on her mission, she gave one of her tracts to the girl, and induced her to leave the place. She then learnt that her suspicions were correct, and that the girl was on the eve of destruction. She was admitted to a home.

Another portion of the day-work consists in visiting the wretched houses in which these poor girls live. Sometimes this is done when the address has been given overnight, in the hope that under different circumstances some good may result from an affectionate exhortation or solemn warning. At other times it is done more generally, with the desire to benefit both the keepers of the houses and their inmates. These visits are made alike to houses in some wretched alley, and to the more fashionable resorts of the upper classes. In one of the latter a missionary has remained for two hours, speaking plainly and faithfully of the way of salvation. And some who were forcibly detained, have by these means been rescued. They have been offered a home if they could effect their escape, and they have gladly accepted the offer.

An effect has also been produced on the keepers of the houses. When spoken to on the evil they were encouraging, and the part they were themselves taking in it, they have sometimes, with tears in their eyes, confessed they were wrong, but declared they were driven to it through poverty, being left widows with families; but by constantly visiting and speaking kindly to them, several have been induced to give up their houses.

In the prosecution of their work the missionaries are frequently the means of restoring fallen ones to their friends. For, though cases are not uncommon in which a departure from virtue (even where this has been forced on the poor victim) is a bar for ever to the parental roof, yet there are many who will thankfully receive back the wanderer on the interposition of a friend. Such was the case with L. M. She came to the missionary and recited a sad tale of seduction, where the seducer turned out to be a married man, whom she had left on ascertaining the fact. She was then driven to desperation; fearing to return home, she had rushed on still lower and deeper in crime, till after a sickening and heart-rending experience of six weeks' exposure on the streets, she was mercifully arrested in her course, and determined, by God's blessing, to return to her home, seek the forgiveness of her parents—respectable people—and apply herself to some honest and virtuous mode of gaining a living. She was sent to her friends, and received a warm welcome. Her father was declining in health, but he had lived to pardon and bless her.

The missionaries have also been useful in rescuing those who have not fallen, from the evil influences to which they are exposed at home, and which would in all human probability lead to their ruin. A young girl of fifteen stated that she was the daughter of a woman who she shamed to say had recourse to prostitution to procure, not the means of living, but the means of getting drink; that her clothes had been taken to procure food; and that she had been three days confined to her bed, being literally unable to get up for want of clothing. The girl further said she herself would die sooner than resort to so vile a means to procure bread; and if ever there was sincerity denoted in a human face it was in hers, as she said,—"Oh, madam, I should sooner go into the workhouse, and stay there for ever, than become a bad woman." The missionary procured the girl some clothing, took her to her house, and after a few days got her into a Refuge, where, though much persecuted by her drunken and depraved mother, she continued to do well, and is now giving much satisfaction in respectable service.

The daily and hourly intercourse which the missionaries have with the fallen has enabled them to learn much of their previous history, and of the causes which led to their ruin. And although a great deal has been written and published on this point, the following statement of one of the missionaries will not be without interest:—

"During the time I have been engaged in the mission I have had occasion to hear the history of some hundreds of these poor fallen girls, and of learning the events which occasioned their ruin. It may not be uninteresting, then, to trace the cause or causes which most frequently lead to this sad result, and to consider the circumstances and ages which are most calculated to produce the fall from virtue to its opposite.

"I should say, then, the common opinion that a woman is first betrayed, then deserted, and driven to street prostitution, is by no means so general as the universal supposition would make it appear. At the same time it does frequently take place.

"Amongst the lower order of unfortunates, their own sex—those that have already fallen—are far more frequently the agents of their ruin. They entice foolish young girls of sixteen or seventeen to remain out at night till past the permitted hour; then when frightened to return to their homes, allure them to their dens 'just for the one night.' But the poor victim once there, is either talked into 'the life,' or else, if she resolves to return to her home the next day, finds when the morning comes that any place—the streets even—are preferable; for, alas! she dare not go home. The evening before she was guilty of what was comparatively a trivial fault; now she is a poor, polluted, lost creature, despised by others, hateful to herself.

"Another, and I think the most fruitful source of ruin, is indolence. Some girls will do anything sooner than work; and these are the least reclaimable of any.

"A third cause is vanity—a love of dress—a thirst for pleasure. I place them together, because they are generally united. These, unlike those possessed by indolence, are very often open to reclamation. The poor painted butterfly sickens at its borrowed colours, and longs for the quiet home enjoyments it once possessed, instead of its ceaseless round of dissipation, which she knows must end in everlasting misery. The following is one amongst many instances I could record in illustration of this. A young girl aged 17 was training to be a National schoolmistress. Whilst in her pupilage she imbibed an inordinate love for dress and amusement, and though her parents were both respectable and religious, she absolutely fell, to procure those imagined enjoyments. But

Digitized by Google

a short time sufficed to satiate her with what once she esteemed to be a never-failing source of happiness. Stung by her conscience, torn by the anguish of remorse, she leant a willing ear to the advice which was given, entered an Institution, and is now in a clergyman's family, enjoying peace and happiness in her own soul, and giving satisfaction to her employer.

"Another, and a very frequent cause of driving girls to prostitution, is the second marriage of parents, especially fathers. I have known an innumerable number of girls of fifteen and sixteen leave their homes and go on the streets because they and their step-mothers could not agree.

"Then not a few fall into this sin on account of the irreligious and immoral example set them by their own parents. An interesting girl of 15, whom I was fortunate enough to rescue from off the streets, which she had been on only three weeks, told me her mother had deserted her father and five children, and was living in adultery with an old man, himself the father of grown-up children.

"It is also well known the system of letting the different members of a family herd together in the one sleeping apartment, irrespective of sex or age, has a most demoralising tendency.

"Of course there are many instances arising from innate depravity—a love of drink, loss of character from dishonesty, and such like causes—which give rise to the sights we nightly witness in our streets. But if our senses are shocked and our ears horrified often by the things we see and hear, our hearts, too, are wrung by listening to the sad recital of some of these poor wanderers. How many of them, once innocent, happy girls, were driven by dire destitution to pursue the hateful career by which they plunge their souls into everlasting misery, to gain often but the mere crust, which only just saves them from downright starvation. How many have borne up nobly and long against privation. stitched and stitched on until they could procure the ill-paid work no longer; then, driven to despair, have rushed on to crime, regardless of the consequences: or, if they sometimes think, drown the reflection in the gin-palace, or else hope against hope and truth that they will meet from their offended God that mercy which man has denied them here."

It only remains to add, that through the instrumentality of the missionaries more than 300 girls have been rescued from their life of sin, or the danger which threatened them, and placed in homes, independently of those who have been restored to their friends without entering an institution.

While a small proportion have disappointed the hopes which had been formed concerning them, of very many the most encouraging accounts have been received. Thus the Chaplain of one Institution states, "We have fourteen women now in this Refuge, introduced by your missionaries, all doing well. Several others recommended by your committee have been sent to service this year, and one will leave in a fortnight to enter the service of a respectable family in the country as housemaid." Gratifying letters are from time to time received from some in service and others restored to their friends; and on the whole, notwithstanding the drawbacks incident to this as to all missionary work, there are abundant encouragements to adopt the motto "Go forward."

Notes on various efforts to Improve the Domiciliary Condition of the Labouring Classes. By Henry Roberts, F.S.A. Abstract of a Paper read at the Meeting of the British Association for the Advancement of Science, held in Oxford, in June, 1860.

(Reprinted from the *Civil Engineer and Architect's Journal*, August, 1860).

The author stated numerous facts, the result of many years' experience, during which he has devoted much time to this object both in England and on the Continent. After referring to the occurrence of unexpected difficulties, not uncommon in the early stages of new undertakings, Mr. Roberts observed, that to be daunted by difficulties is foreign to the English character, and that this should be the case especially when the object in view is the benefit of our fellow-creatures.

Assuming that something of the actual domiciliary state of vast masses of our fellow-creatures is known to most, it was remarked, that "but few have sounded the depths of its misery or of its degradation, and none can fully estimate its evil results."

To remove the impression which has been produced by the want of pecuniary success in several instances, that dwellings of an improved character for working people cannot be built so as to be remunerative, reasons were adduced for the failures which have occurred; and facts were given tending to show that there had been a number of cases more or less successful. The Metropolitan Association for Improving the Dwellings of the Industrious Classes, from six buildings in different parts of the metropolis, on which 71,328*l.* had been expended in providing accommodation for 395 families, had received for the past year, after deducting all current expenses and repairs, 3¾ per cent. on the outlay. On two lodging-houses for single men, one of them new, accommodating 234, the other old, which provides for 128, a considerable loss had arisen, in consequence of their not being fully occupied. The buildings in these instances must be either too large, or in some other way unadapted to the class of men frequenting the neighbourhood. A similar result has been experienced at Marseilles through the choice of a site outside the town, too far from the men's daily occupation; whilst at Leeds and Liverpool, in buildings on a smaller scale and better placed, increased accommodation had been required. Passing to a consideration of the undertaking of the Society for Improving the Condition of the Labouring Classes, although the accounts did not afford the same facility as the other case for ascertaining the pecuniary return on the investment, the author showed that from the model buildings at Bagnigge-wells, Streatham-street, and George-street, the return collectively, after a deduction of ¾ per cent. for repairs, was in 1852 (when Mr. Roberts was honorary architect to the society), 4½ per cent. net. The return from the Streatham-street building, which is wholly for families, was higher than from the other two, being 5 per cent. net. The rents were fixed below those usually paid for a similar extent of accommodation. The new buildings in Portpool-lane were avowedly of so experimental and mixed a character, that the pecuniary results are not a criterion generally applicable. They may serve as a caution against providing too largely in one building for single women. The average occupation of 64 rooms has not exceeded 50 to 52, and more stringent regulations were required than in the men's lodging-houses. The public baths and wash-houses forming part of this building have not been remunerative. In his calculations of the return on the first-named piles of building, Mr. Roberts explained that 4 per cent. interest was allowed on the cost of the land, and per cent. for repairs, the buildings being new; on old buildings the repairs should be taken at 1½ to 2 per cent. In the case of two lodging-houses, which are old buildings and leasehold (one in Charles-street and the other in King-street), the clear return, after deducting 2 per cent. for repairs, was at the period before mentioned 15 per cent. clear. In the case of three old courts in different localities, 7,226*l.* had been expended within the past six years in putting them into a good sanitary state, with suitable fittings, including a small lodging-house for single men, and the return had been much less satisfactory. In 1858 it was, after deducting 1½ per cent. for repairs, only about 1½ per cent. on the outlay; and in the past year the net receipts had diminished considerably. Great as the improvement had been, the actual benefit resulting to the occupants of the courts, when they were taken by the society, was not to the extent which might be supposed, as a considerable portion of them had been ejected, not only to reduce the numbers within a due limit, but in order also to secure a more eligible class of tenants.

From the facts and figures given it would appear, that whilst old houses may be dealt with for men's lodging-houses with a fair prospect of remunerative return (though the results will depend on the manner in which the work is done,

Digitized by Google

as well as on watchful management), courts and old buildings in the metropolis, put into sanitary condition and fitted up for families, unless obtainable at a much lower price than they usually are, will not yield a satisfactory return, after provision had been made for repairs and a sinking fund to pay off the capital, which there should be, especially in the case of leasehold property. It was, however, stated, that the Hastings Cottage Improvement Society had during the past three years succeeded in paying a dividend of 6 per cent. to their shareholders. It forms a main feature of that society's administration to disturb existing occupants as little as possible; and they have a reserve fund of 1 per cent. per annum.

The sanitary and moral results of the operations of the two London societies, need not here be recapitulated. The point required to be got at is, the reason for any ill success which there has been in the financial returns, and in the extent to which the example has been followed by speculators, or by philanthropists, who would gladly select the form of investment in buildings of the kind referred, were they assured of a moderate return. The sanitary and moral effects, taking them as a mere drop in the ocean, compared to the extent and vast population of London, the author did not consider were unimportant, or when compared with those in Paris, encouraged by a Government subvention of 10,000,000 francs. For a description of what has been done in the British metropolis and elsewhere, the author referred to his paper on the Improvement of the Dwellings of the Labouring Classes, given in the "Transactions of the National Association for the Promotion of Social Science," for 1858.

Amongst the facts regarding financial success in London, it was stated that at Shadwell, close to the line of the Blackwall Railway, some miserable dwellings came into the possession of a gentleman, Mr. W. E. Hilliard, of Gray's-inn, who thereupon decided to endeavour to improve his own property; and also, by example, the immediate neighbourhood. The old dwellings were replaced by a street, with dwellings on Mr. Roberts's plan, as exhibited in 1851, in the Prince Consort's model houses. There are twenty-eight blocks, each of four residences—112 families in all being provided for. The cost of each block was 487*l.*; and, after allowing for ground-rent and all charges, the authority of the owner was given that they continued to "pay upwards of 6 per cent., and, in fact, nearly 7 per cent., as a net return on the investment;" whilst the same competent judge spoke of the facts as of "perhaps more consequence," that the houses were "almost constantly let," and were "appreciated by the tenants," who, "as a rule," were "pretty stationary, and not migratory, as that class frequently are."

In the last-named case, we have thus an outlay of 14,000*l.* on new buildings, containing 448 rooms, kitchens included, yielding 6 to 7 per cent.; whilst the cost of putting into sanitary condition the three old courts before alluded to, which contain 275 rooms, and a lodging-house with forty beds, had been upwards of 7,000*l.*; and in that instance the return on outlay has been 1¼ per cent., after deducting 1½ per cent. for repairs, but making no allowance for sinking fund.

Mr. Roberts referred to the practical results of the interest taken by the Prince Consort in this object in connection with the Great Exhibition, in its having led in several instances to the providing accommodation for married soldiers; a want which led the late Duke of Wellington to object to the model houses being placed in the barrack-yard at Knightsbridge, lest it should cause dissatisfaction in the army In the present session of parliament 30,000*l.* have been voted for this object.

The Windsor Royal Society, with 9,000*l.* invested in new cottages and two lodging-houses, pays a dividend of 4 per cent. to the shareholders. At Liverpool, on a range of dwellings for twenty-three families in Upper Frederick-street, built after the general plan of the Exhibition model houses, 4¾ per cent. is realised. The association at Brighton has also built one block of six houses on the same plan, and a fair return is obtained.

Not fewer than twenty societies have been established in provincial towns, the results to occupants being in every case beneficial; and whilst the financial results have varied so far as to show the necessity of competent skill in planning, and watchful supervision, they are yet valuable. One instance from Scotland, that of the Pilrig model buildings, near Leith-walk, Edinburgh, was added by Mr. Roberts. There are forty-four dwellings in three blocks, with access on both sides, the upper floor tenements approached from one side, and the ground-floor from the other. By economy the cost was only 4,052*l.* 15s. 9d., or about 92*l.* per house. The rent of the whole is 303*l.* 19s., or varying from 5*l.* 5s. to 9*l.* 15s. per house, one half of them not exceeding 6*l.* 6s. per house. The rents were purposely made low. After deduction of all expenses, namely, fee duty, 22*l.* 14s. 10d.; insurance, 5*l.* 12s. 6d.; rates and taxes, 13*l.* 11s. 2½d.; repairs, 13*l.* 4s. 7d.; management, 21*l.* 6s. 3d.; and paying a dividend of 5 per cent. (less Income-tax), a balance of 30*l.* 13s. 1d. was last year added to the sinking fund, from which sundry expenses, as painting and papering, are defrayed; this fund now amounting to nearly 200*l.* The demand for the tenements is generally six times the supply.

Besides the instances which have been given, allusion was made to what has been done through a sense of duty and enlightened views of self-interest on the part of many landed proprietors and other employers of labour, as well as through the operations of building societies, the machinery of which might be further developed. Improved dwellings ought to be provided in the metropolis and elsewhere, as a consequence of the demolitions effected in the formation of new streets, and this should be rendered compulsory. An existing standing order of the House of Lords for the investigation of such cases has practically become a dead letter. The legislature should also interfere in the case of all tenements let at low rents in thickly populated towns, as they have done with so much success in the case of lodging-houses: such a power exists in the City, and is ably administered under the medical officer of health, to the great benefit of the poor and a sensible diminution of the mortality. The death rate in the City has diminished from 25 to 23 in 1,000.

In conclusion, reference was made to the encouragement afforded by a recollection of the change which has taken place in the state of our prisons, which are no longer hot-beds of fever and moral contagion, as they formerly were.

In the discussion which followed, Mr. Edwin Chadwick contended that results of improvement were even more favourable to the objects of the author of the paper than would be supposed from what had been stated, and adduced the facts of the gain by sanitary measures in towns. Reference being made to the branch of the subject connected with cottages in agricultural districts, Mr. C. H. Bracebridge described some cottages which he had built at Atherstone, Warwickshire, each containing equal to three bedrooms, and which had cost, exclusive of closets at the back, but inclusive of a common washhouse and dustbin to a group of five houses, as well as pathway, 81*l.* 6s. per cottage. The object of low cost, and the provision of the third bedroom were attained by placing the bedroom in the roof altogether, or nearly so. The roofs being constructed with queen-posts, the room was got in the space between the "queens." The area in the clear covered by each house was twenty-one feet by thirteen feet; the room on the ground floor was thirteen feet square; and the space for stairs and other features of the plan, thirteen feet by eight feet, including the partition. The room in the roof which ran from end to end, was of adequate height, and it cost about 6*l.* of the amount named as that for the whole cottage. This room was not, it was true, a very good one, and it had to be reached by some kind of ladder; nevertheless it served the purpose, and it had an advantage over a better room, as it could not so well be let. Water supply, except that from the roof, is not included in the amount named.

Reviews.

Proceedings of the Second Convention of Managers and Superintendents of Houses of Refuge, Shools of Reform, and Institutions for the Prevention and Correction of Juvenile Destitution, Delinquency, and Crime in the United States of America, held in the City of New York, on the 10th, 11th, and 12th days of May, 1859. New York, 1860.

The programme of subjects for discussion at the New York Congress comprehends many points of inquiry of general and vital interest to the Reformatory movement, irrespective of place and nation; and the Report of the discussions conducted by experienced leaders and officers of that movement in the United States is especially valuable, in itself from the excellence of the American Reformatory Institutions, and to English people from affinity of race and similar bonds of national sympathy.

The topics of discussion were—

1. The distinction which should be observed between vagrancy and destitution.

2. The comparative value of the family and congregated systems in Reformatory Institutions.

3. The true principles of legislation in respect to vagrant and criminal children.

4. The training of instructors, both male and female, for Reformatory Institutions, Asylums, &c.

5. The best system of education in Reformatories.

6. The best system of discipline.

The resolutions elicited by the discussion of the first topic were—

"That institutions for the prevention of juvenile crime, and institutions for the reform of juvenile offenders, should be kept entirely distinct, and be under the control of separate and distinct boards."

"That mere destitution should not be classed with crime, nor should vagrancy be regarded criminal, except in cases where it is voluntary, and has become a fixed habit of life."

The passing of these resolutions was proceeded and followed by statements of many interesting details from the gentlemen conducting the various Reformatories represented at the Congress. The result of these statements is to show that *crime, vagrancy,* and *destitution* need separate remedial institutions; if not, as the resolution proposes, under the control of separate boards, yet certainly under separate acting managers, and as distinct homes and institutions.

At New York there are existing three such institutions, founded and supported by different societies. The description of these institutions is quoted from the speech of Mr. J. A. Bryan, of the New York Juvenile Asylum.

"The three institutions referred to were the New York House of Refuge, the New York Juvenile Asylum, and the New York Children's Aid Society; all which represent three different plans or systems, and, taken together, occupy the whole range of the several classes of children in need of our help or treatment; so that, if the gentlemen of the Convention shall come to understand fully the plans upon which these organisations proceed, I am of the belief that they will have the whole subject before them, and can judge of the relative merits of the different systems laid down by each.

"The 'House of Refuge' is the pioneer institution in the great work of reforming juvenile delinquents, and was incorporated in 1824. So far as I have been able to learn, nothing of the kind had ever previously been put in practice in this country. It was in the nature of a benevolent society, and not strictly a prison. The managers and officers were not appointed by the State or city authorities, but were chosen by the subscribers. It was initiated by several of our most prominent and influential citizens, some of whom have remained in it up to the present time; and it has been deservedly considered one of the most popular institutions of the kind in the entire country. I have never heard a word raised against it. I have never heard a single suspicion uttered with respect to its management. The Legislature has testified its confidence in its management by many large contributions from the State Treasury, and it has grown up from a small association of benevolent men, and with comparatively small means, until we find it now a large and noble institution, located in a matchless institution, capable of accommodating one thousand inmates. . . . . .

"This institution makes provision for what may properly be denominated incipient criminals. If a boy under the age of fourteen commits a theft, though it is a crime, yet, in consideration of his tender years, the law prefers, by a well-tempered mercy, and with a desire to reform the delinquent, and ultimately have him restored to society, that he should be put into a *quasi* prison, and not be subjected to the odium and disgrace of being confined as a culprit or felon. It also has committed to it vagrant children; and, it may be a question for very serious consideration, whether that is, under all the circumstances, proper. I have no doubt the managers have duly considered that question; but I believe that the number who are strictly denominated vagrant, and now sent to that institution, is very small. It is probable that, in the course of a short time, owing to an increase of our population, and the consequent increase of juvenile delinquency, this institution will be compelled, in the exercise of its peculiar function, to take charge of those who are denominated incipient criminals exclusively, so that those who are the objects of their care, and denominated incipient vagrants, will have to be transferred to the control of some other organisation.

"After many years it was found that the House of Refuge was not calculated to meet a certain want which existed here. Up to the year 1851, it was relied on to take charge of all those children who were deemed proper subjects for a Reformatory; but in that year it became quite evident that many were sent there who were not proper objects, and who could not be there properly provided for. We might mention, among this class, beggars, petty pilferers, children who take ash-barrels, fuel, sugar out of hogsheads on the wharves, fruit, and other trifling things, it may be through ignorance, or the compulsion of parents, and without being aware of the nature or criminality of their acts. Such, it was considered, were not suitable for an institution designed to take charge of 'criminals.' This class also embraced truants, children of degraded women, and of low gamblers, children of poor parents, imprisoned for crime, and who were supposed to have been tainted by the example of such persons, children of habitual drunkards, and the morally degraded or vicious children who have been subjected to the contaminating influences of such evil associations. Proper means were wanting to reach that class who were in danger of speedily becoming, but who had not yet actually become, incipient criminals—those who were exposed to crime and its temptations—who were abandoned, and were likely to resort to any means to get a support; and, being left entirely to themselves, were likely to go to ruin. With these facts before them, a number of gentlemen inaugurated this plan of the New York Juvenile Asylum. It was not in contemplation that the powers and duties which should be imposed by the Legislature, in its charter, should in any way infringe upon the labours of the House of Refuge. It was intended to relieve a class that the House of Refuge could not; and it has been built up and maintained for this object.

"It may be called the pioneer institution in this peculiar field of philanthropic effort. I am not aware that any other organisation of a similar character was formed previous to this, nevertheless I may be mistaken.

"It was discovered, after a short time, that the peculiar objects of the Juvenile Asylum did not supply all the requirements demanded in behalf of the children of our vagrant and destitute population; and I believe the Children's Aid Society was formed and put into operation for the

Digitized by Google

purpose of providing for a class not specially designed to be reached by the Asylum or the Refuge. This society intended to confine its efforts to unfortunate children, those who had been measurably well cared for, those who had enjoyed some of the influences of comparatively decent homes; but who, through the misfortune of parents, stood in need of assistance from the benevolent. By the terms of its charter, its purpose was 'to improve the condition of the poor and destitute children of the city of New York."

The discussion of the second topic, the comparison of the family and congregated systems, was opened by an address from the Rev. B. K. Pierce, superintendent of the State Industrial School for Girls, Lancaster, Mass., showing the advantages of the family system—that pursued at the Lancaster Institution—both as to economy, classification, and moral influence, the three heads of inquiry proposed. Though no definite resolution on the question is recorded by the Report, the result of the conversation was decidedly in favour of that system, with modifications in certain places and cases. Mr. Pierce argues:—

"The family system admits of much less elaborate and inexpensive edifices. They may be constructed with the simple arrangements of an ordinary family, with no conveniences not common to the working classes. In this way, a large outlay at the first may be saved, and the institution defended from the prevalent prejudice, that a sickly benevolence is providing for the indolent and vicious more comfortable homes than the virtuous poor can provide for themselves. But, what is of greater importance, the inmates will be accustomed to the inconveniences and methods of life to which the most of them are incident when they leave the institution. The separate homes may be managed more cheaply and still with greater personal comfort, by the creation of a mutual emulation and competition among them to secure the most economical outlays. There will be a closer and more constant supervision of the public stores, a wholesome feeling of personal interest in the care and credit of their special home on the part of the inmates. In the original construction and in the daily details, economy may be appropriately and even severely exercised, and with proper management the difference of expense between the two systems may be rendered very slight.

"It is evident that the family system affords peculiar opportunities for classification, or, rather, we should say, for adaptation.

"We have serious doubts as to the expediency of the division of an institution into companies, upon either the basis of age or character; for this is entirely unnatural and artificial. The very depraved children are not always found to be the oldest; many of quite tender years exhibit frightfully vicious dispositions and habits. In herding together the peculiarly incorrigible inmates, and rendering them a dishonoured class by themselves, the probabilities of their reformation seem to be greatly decreased. They will probably sink together. In limited families, the more difficult to manage may be distributed around in small numbers, where the moral preponderance is on the right side. Special adaptations in the matrons and in the condition of the families may in this way be secured. In every institution of the character we are considering, the policy is to remove the inmates as early as possible after a hopeful improvement is discovered. The result must be that a large number of very perverse children remain behind, giving a sad moral tone to the institution, and exerting an unpromising influence over the new comers. The inmates that are to occupy the vacant places are coming from the streets, ignorant, wilful, and wicked. On the congregated plan, this continual sifting out of the good elements, and fresh infusion of evil, must be very serious in its consequences, where from three hundred to six hundred are gathered together. Such an institution for girls, established a number of years since in Boston, after a period of about ten years each time, was twice interrupted, and all the inmates cleared out to commence anew, and finally was discontinued, as the preponderance of evil had become so great. While this necessary evil is not entirely obviated under the family system, it is essentially limited, and surrounded with admirable restraints. The number together is small. They can easily be changed, when there is anything like a combination, and the nearness to them, continually, of the superintending and educating element, acts as a powerful curb upon this mutual influence for evil."

The remarks of Mr. Charles Remelin, of Ohio, contained most interesting accounts of the Ohio State Farm, and the wholesome influences of its regimen on its inmates. Space will not allow of extracts from them.

The subject of the principles of Legislation brought out statements of the local police regulations concerning vagrant children in the different cities of the States, all tending to prove that where begging was prohibited, vagrancy and its attendant, juvenile crime, were materially lessened. Dr. Inwood, of New Orleans, states:—

"New Orleans might be termed one of the most depraved cities in the United States, yet there is scarcely ever seen a vagrant child in her streets. The law requires each and every police officer, when he sees a truant child upon the streets, whether he has any testimony of his being a vagrant or not, if his mere appearance indicates that he is such, to address him. If he has a parent or guardian, with whom he lives, the officer follows him home, and ascertains that such is the case. If the child cannot give any account of himself, he is brought before the Recorder, and his friends, if he has any, are notified. If the child is proved to be a vagrant, he is committed to the House of Refuge. This system has been pursued for something like ten years; and now the children that are committed to our House of Refuge are those that come from other cities by steamboat—from St. Louis, Pittsburg, Cincinnati, and some as far off as Baltimore."

The opinions of many delegates implied great want of confidence in the judgment and moral character of the ordinary police in a charge of this kind. The organisation of a special police, or a special officer in every city for this work, was suggested and approved. The legislative policy best calculated to further Reformatory work was described by Mr. Hill, of Rochester:—

"The moment the Legislature puts into legislation any detail with reference to the case of juvenile delinquents, or the inmates or subjects of any of our Reformatory Institutions, they inevitably display their ignorance, and make mistakes. Hence, the Act which incorporates any of these institutions ought to be in the simplest form, simply creating the institution, naming the trustees, dividing them into classes, and determining the time that each should hold office. The Act ought also to name building commissioners, because the managers have enough to do besides building. Building is a burthen too heavy to be thrown upon the managers of any Reformatory Institution. The Act ought to provide, that all persons convicted of crime under a given age should be committed to the trustees *in loco parentis*, to take charge of them, to take care of them, to bring them up; not merely to furnish them food and clothing, but to take them from their present state of degradation, and make men and women of them, by educating them at large, giving them employment, habits of industry, order, and cleanliness; preparing them for usefulness in the world, for their own happiness, here and hereafter; educating them wholly; and, being in the position of parents and guardians, binding them out when they shall have so far reformed as to be fit subjects for recommendation; and totally discharging them when they shall have formed a character which would justify it. The Legislature ought to provide none of these details, merely authorising the commissioners to build a house, the courts making the first appointment of trustees, determining how long they shall hold office, and for what crimes and vagrancies children shall be committed. Perhaps, in some States, the courts by law might be authorised to commit to such places without having the crime spread upon the record. That might involve a difficult matter, for a crime is a crime in a child as well as in a man. Hence, whatever alteration should be made in the general law of the land, would be a difficult and delicate thing to do. But one thing is certain, that no time ought to be fixed. The Legislature ought never to provide a law by which a court should sentence to Reformatory Institutions for any period of time; for the reason, in the first place, which covers all other reasons, that it is subversive of reform to sentence a child for any time, because you thereby give the idea that he is put there for punishment. Re-

Digitized by Google

formatory Institutions are not intended to be Institutions for punishment. The boys in the Institution with which I am connected do not deem themselves punished; they are happy in the idea that they are taken there to be cared for, and brought up. The idea of setting a time for commitment, as they have by the laws of some other States, is utterly subversive of the objects of the Institution. The legislator cannot know whether a child can be reformed in a given time, nor are the courts any judges as to that."

The training of instructors, which formed the fourth topic of consideration, was introduced by the reading of a paper by the Rev. D. B. Nichols, superintendent of the Chicago Reform School. If the candidates for employment in the work of reformation could be imbued with the spirit of mind described by Mr. Nichols, there would be less need of any definite method and course of training.

"This work is, as before stated, a peculiar work. This species of labour has its own trials and perplexities, and is attended by its own reward. This work calls for a peculiar class of workers. Not every good man or woman is qualified for a position in a Reformatory as a labourer. The talent demanded by these schools is rare. We need not expect success in a Reformatory, only as its labour is performed by qualified persons. The question of qualifications is one of importance. It is a question with which the interests of our Reformatories are deeply concerned.

"The question as to what are the qualifications required, in order to be a successful labourer in a Reformatory, is one which applicants for place as helpers in such schools should carefully study before they accept a berth in such an institution. To this question of qualifications it is my purpose now to address my thoughts. The first qualification we shall notice, as required of a labourer in the Reformatory, is that:—

"The applicant for a berth as a helper in a Reformatory should be a Worker.

"Overseers are abundant; the market is glutted with this class, but workers are few. I use the term worker in a large sense. I mean the applicant should know how to work with his own hands; that he has had a previous training in manual labour. The importance of this knowledge in a labourer in a Reformatory cannot be well over-estimated. These schools are industrial schools. The pupils in these schools are not only taught to read and write, but are taught to work. When pupils are sent to these schools, they are almost entirely destitute of the knowledge of how to work. The educator, if he would be successful in training the pupils of his charge to be industrious, must first be himself industrious. If he would instruct his charge in some kind of manual labour, he must know how to work himself. The pupil must see that he is not ashamed to work with his hands, and this will be a stronger argument than any other can be to show the pupil that it is not disgraceful to work.

"Practice in the education is far more important here than precept. These youth want a model. There is no danger of their proving truants from tutor or slighting their work, so long as one whom they respect and love is working at their side. It is a mistake that boys do not love to work. It is true that they do not love to work alone; but put a company of boys, with an industrious and pleasant man to work with them and direct their energies, and nothing could better please them.

"The school should also be supplied with a teacher who is a worker. Many of these youths have been made truants from school by being sent to prosy teachers.

"A man who would be a successful teacher in a Reformatory must be one who is alive and wide awake. If this plan do not succeed, he should try that. If he fails to interest his pupils by one means, he should try others. Moral training must also be performed by the same active and efficient instrumentality.

"In a well-conducted Reformatory there is nothing but work. Whoever enters a school of this class with the thought that he flies from labour never made a greater mistake.

"This work is hard work, continuous work, from the earliest dawn of day until night with her mantle encircles the earth. Here are youth who have had bad training. All their habits of character, thus far, have been wrong. These bad roots must be rooted out. The soil of the heart has then to be properly prepared. The seeds of virtue have to be sown. The plant, after it has come up, must be nursed with the greatest care. It must be watered, and have plenty of sunshine, that its growth may be strong and vigorous. Line is to be given upon line; precept is to be added to precept. Here a little is given; there is a little supplied. One day's labour follows another. Week is added to week, and months of hard work fill up the year. No one can succeed in a Reformatory who is not a worker. No one will meet with a more grievous disappointment than the one who goes to labour in such a school in hopes of finding rest. Like Noah's dove, he will find no rest to the soles of his feet. He will find the motto of these institutions to be 'Labour here, but rest in Heaven.'"

But as the character is rare which, by mere intellectual comprehension of the duties in hand, and moral energy to fulfil them, can enable its possessor to carry them out in detail without practical training, some system in preparing instructors for their work must be acted upon. That pursued in the Raube Haus at Hamburgh, and other similar institutions throughout Europe, was brought before the Convention. It may be described, as it is carried out at the Ohio State Reform Farm, as a probationary system. Young men who have recently completed their own college or school education are invited, and often propose themselves as "trial elder brothers" to the institution. They live free of expense, but receive no pay, and give themselves to such work as the superintendent prescribes to them. Such a residence in a large industrial establishment is in itself a training of the candidate himself as a farmer, overseer, or foreman, supposing him to develope no qualification for reformatory work, and to leave the institution at the end of his time. In many cases a capacity for and love of the work is developed, and the young men become "elder brothers," and take their place and work as such in the house. They are then paid and provided for as such, remaining in their first school of trial or drafting off to others needing them, as circumstances dictate. This method ensures, as far as any method can, that the work shall be chosen for its own sake; that when so chosen it affords a maintenance and provision to the instructor, does not invalidate the good of his free choice, only enables him to persevere in it.

The fifth topic, namely, the best system of education, and the sixth, the best system of discipline, may be comprehended in one account. The evidence on the system of teaching and the things to be taught, all tended to establish the importance of industrial over mere scholastic teaching. And in this, as in everything, the character of the child must determine the preponderance of either to suit the individual. Some children learn to read with labour, and to work handily with ease, and the reverse. It is a waste of a child's training time to make him acquire more book knowledge than he can accomplish in the time devoted to it for averagely intelligent children—who may learn far more in that time than he does—when there is in him, or her, the making of a good manual worker. It would be better to lessen the time in that case, and lengthen it in that of children of obvious intellectual power. Moreover, industrial work is especially favourable to moral training; not merely knowing our duty, but doing it is the end of education, and work to be done, and done well, is the best school in which a child can prove his will to do good or evil. On discipline, the opinions were unanimous that the law of kindness was the most compelling. At the same time, and as in the spirit of that law, the delegates were agreed that where punishment was needed it should be enforced, with the full showing to the offender and his companions how and why it was administered.

The Convention closed with a vote of thanks to the President, for the able and courteous manner in which he had conducted its meetings.

METROPOLITAN FREE HOSPITAL, DEVONSHIRE-SQUARE, BISHOPSGATE, CITY, N.E.

PATRON.

His Royal Highness the PRINCE CONSORT, K.G., &c., &c.

VICE-PATRON.

The Right Hon. the LORD MAYOR.

This Hospital is open to the Sick Poor of all creeds and countries without the troublesome and too often prejudicial impediment of a Governor's letter of recommendation.

A Bazaar for the Sale of Useful and Ornamental Work will be held in aid of the Funds of this Institution in Crosby Hall, Bishopsgate-street, on Wednesday and Thursday, the 19th and 20th December, 1860, under the following distinguished patronage.

The LADY MAYORESS.

Marchioness of Winchester.	Viscountess Hereford.
Marchioness of Stafford.	Viscountess Sydney.
Marchioness of Waterford.	Baroness North.
Dowager Marchioness of Londonderry.	Baroness De la Zouche.
Marchioness of Thomond.	Lady Churchill.
Dowager Countess of Chichester.	Lady Ashburton.
Countess of Oxford.	Lady De L'Isle and Dudley.
Countess of Shrewsbury and Talbot.	Lady Denman.
Countess of Shaftesbury.	Dowager Lady Erskine.
Countess Fitz-William.	Lady Rayleigh.
Countess Fortescue.	Lady Ribblesdale.
Countess of Huddington.	Lady Selsey.
Countess of Portsmouth.	Lady Curzon.
Countess of Sheffield.	Lady Tredegar.
Countess of Chesterfield.	Lady Wensleydale.
Countess of Seafield.	Lady Ernest Bruce.
Countess of Roseberry.	Lady Alfred Paget.
Countess of Shannon.	Lady Edward Thynne.
Countess of Courtown.	Lady Maynard Hesilrige.
Countess of Errol.	Lady Buxton.
Countess of Antrim.	Lady Barnard.
Countess of Egremont.	Lady Broke Middleton.
Countess of Scarborough.	Lady Scott of Abbotsford.
Countess of Stradbroke.	Lady Shelley.
Countess De Flahault.	Lady Frederick Smith.
Dowager Countess of Lichfield.	Lady Winnington.
Viscountess Combermere.	Hon. Mrs. Rashleigh.
Viscountess Grey de Witton.	Mrs. Samuel Gurney.
Viscountess Forbes.	Mrs. John Gurney Fry.
	Mrs. W. L. Ogilby.
	Mrs. Reynolds.
	Miss Fry.

A Grand Military Band will be in attendance.

Tickets of Admission, One Shilling each, may be obtained of Mr. Defries, 147, Houndsditch, E.C.; Mrs. Murrell, 17, Milner-square, Islington, N.; Mrs. Defries, Brunswick-square, W.C.; Mrs. Henry Defries, 50, Tavistock-square, W.C.; at the Estate Exchange, Change-alley, Cornhill; and at the Hospital.

GEO. CROXTON, Secretary.

SPECTACLES—MICROSCOPES—TELESCOPES.—FINE STEEL FRAMES, with REAL PEBBLES, 7s. 6d. and 10s. 6d.: ditto, best Glasses, 5s. 6d., 4s. 6d., 3s. 6d.; Solid Gold, 20s.; Silver, 10s. 6d.

BERNARD DAVIS, 430, Euston Road, Regent's Park (close to Trinity Church), Optician to the Ophthalmic Institutions. Country residents can be accurately suited by stating age, &c. Enclose stamps, or P. O. order, payable Upper Baker Street, London.

MICROSCOPES, magnifying from 5,000 to 15,000 times, mahogany cases, 21s., 17s. 6d., 12s. 6d. Ditto, with all necessaries for every purpose, in upright Mahogany Cabinet, magnifying 60,000 times, £4 4s., warranted.

POCKET TELESCOPES, define ten miles, 10s. 6d.; ditto, 20 miles, 21s.

SMALL POCKET TELESCOPES, of immense power, and to show Jupiter's Moons, &c., by night, 60s.

MAGIC LANTERNS and SLIDES complete, 6s. 6d. 9s. 6d., 11s. 6d., 18s. 6d., 21s., 30s., up to 90s. Catalogues free for one stamp.

And he sends a set of six different shades, post free, for Eighteen Postage Stamps.

ALLEN'S PATENT PORTMANTEAUS, AND TRAVELLING BAGS, WITH SQUARE OPENING; Ladies' Dress Trunks, Dressing Bags, with Silver Fittings; Despatch Boxes, Writing and Dressing Cases, and 500 other articles for Home or Continental Travelling, Illustrated in their new Catalogue for 1859. By post for two stamps.

J. W. ALLEN, Manufacturer of Officers' Barrack Furniture, and Military Outfitters (see separate catalogue), 18 and 22, Strand.

REFORMATORY AND REFUGE UNION.

PRESIDENT: The EARL of SHAFTESBURY.

TREASURER: ROBERT SMITH, Esq., 1, Lombard-street, E.C.

HONORARY SECRETARIES:

ROBERT HANBURY, Esq., M.P., 10, Upper Grosvenor-street, W.

STEPHEN CAVE, Esq., M.P., 35, Wilton-place, S.W.

BANKERS:

Messrs. SMITH, PAYNE & Co., 1, Lombard-street, E.C.
Messrs. RANSOM, BOUVERIE & Co., 1, Pall Mall East, S.W.

Contributions are earnestly solicited for the following purposes:—

GENERAL FUND.—For maintaining the general operations, corresponding with the various Institutions throughout the country, procuring the admission of convicted or destitute persons into suitable asylums, publishing Handbooks of information, and generally assisting in the work of Reformatories.

REFUGE FUND.—For making Grants towards the support of existing Institutions, and aiding in the formation of new ones where found necessary; contributing towards the Emigration of those whose good conduct has commended itself to the managers of the Institutions where they have been located; and in other ways assisting the Houseless and the Destitute.

FEMALE MISSION FUND.—For maintaining a Mission to the Fallen Women of the metropolis, and, as may be found practicable, of the country at large; to employ Female Missionaries to labour amongst them; to give donations with cases admitted to the Homes by their instrumentality; and to assist by Grants the Institutions established for the reception of this class.

Further information may be obtained by reference to the Publications of the Union, to be had on application to the Secretary.

A. O. CHARLES, Secretary.

Office of the Union, 118, Pall Mall, S.W.

THE COSTERMONGERS OF LONDON.

On Thursday evening, November 23, a crowded and very orderly meeting of costermongers, fruitsellers, and street hawkers was held at Mr. Green's, Blue Anchor Tavern, Middlesex-street (Petticoat-lane), Whitechapel, "To adopt a memorial, and take measures for staying the proceedings of certain parties who are striving to prevent honest and industrious men gaining their livelihoods, forcing numbers into prisons, and plunging whole families into workhouses." Mr. Brook (a salesman of Leadenhall-market) presided. The chairman said the street hawkers of the metropolis were very unfairly treated by the city magistrates. They were imprisoned and fined for endeavouring to support themselves and families. The markets of London could not possibly manage to get on without them. Mr. Brown (a tradesman) said, although not a costermonger, he was a customer to them, and being a poor man, could not make both ends meet without them, as they prevented a monopoly on the part of the shopkeepers. Several members of the trade addressed the meeting, and in an impressive manner described their struggles to support their families honestly. Some of them stated that they had been in the trade twelve, fifteen, and twenty-one years. They had an intense horror of the poor-house, and would rather starve than go there, and they earnestly hoped that the city magistrates would not drive 50,000 persons to starvation. Mr. M'Sweeny said the capital represented by the London costermongers was 3,000,000*l.*, for which they had no protection. Mr. J. Green said he had been fifteen years a costermonger, and by the dint of honest industry he had become the landlord of that house, and he could assure the gentlemen of the press then present that a more honest and industrious class of men never existed. A memorial to the Lord Mayor, Common Council, and city magistrates was adopted, setting forth the hardships they were subjected to by being deprived of the means of supporting their families, and praying that they might be allowed to pursue an honest calling in the streets of London. Mr. J. Green, of the Blue Anchor, Middlesex-street, and Mr. Brook, Leadenhall, were appointed to receive subscriptions on behalf of the men, and the meeting separated with a vote of thanks to the chairman. A reformed convict, a ticket-of-leave man, at the close of the proceedings, said he had been endeavouring to obtain a living in an honest manner by street hawking, but that he had been fined six times in as many months.

STATISTICAL SOCIETY.

At the meeting of the Statistical Society, held in their room in St. James'-square, on the 20th of November, Colonel Sykes in the chair—

Mr. T. B. L. Baker, of Hardwicke Court, Gloucestershire, read a paper on the criminal returns of 1856-9, with especial reference to the results of reformatories. Mr. Baker's paper was founded on the official criminal returns of England and Wales, prepared by Mr. Redgrave, and his object was to show that the general decrease in crime which those returns exhibit is principally to be attributed to the establishment of reformatories in all parts of the country. It appears from those returns, that the number of commitments of every kind has diminished in the four years included in the returns, from 113,736 in 1856, to 107,172 in 1859, notwithstanding there is now greater activity in the police, and, consequently, a greater number of detections. The diminution in the number of boys under sixteen years of age in the four years 1856-9 was from 10,634 to 6,704, and of girls from 2,108 to 1,185. As to boys, so far as I can ascertain from the magistrates and police of different counties and towns, the race of six or ten times convicted boys—the regular habitual, skilful thieves—has nearly ceased to exist, excepting in London. Nearly every boy on a second if not a first conviction is sent to a reformatory; and even if he be not reformed, even if he leave the reformatory with no sounder principle of honesty than that with which he entered it, at the very least he cannot be practising stealing and corrupting others while he is digging on the farm. The juvenile crime has fallen steadily from 13,981 in 1856, to 8,913 in 1859, being a reduction of 5,068, or 36 per cent., while the adult crime has fallen unsteadily from 99,755 to 98,159, or 1½ per cent. A great deal, in Mr. Baker's estimation, depends on the selection of boys to be sent to those institutions. "I have always," he said, "believed that the real use and value of a Reformatory was not the receiving every boy who happened to yield to some slight temptation, and the keeping him there for his benefit at the country's cost, but the receiving just the leaders of crime, with a view not so much to benefit them as to prevent their leading others astray."

REFORMATORY EFFORTS AMONG WOMEN.

(From the *Record*, Nov. 28, 1860.)

On Monday evening a number of clergymen and gentlemen assembled, by special invitation, at the residence of Mr. Robert Hanbury, M.P., 10, Upper Grosvenor-street, to consider the important question indicated in the title of this notice. Mr. Hanbury is one of the Honorary Secretaries of the Reformatory and Refuge Union, which, by a Special Committee, has been instrumental in originating a Female Mission to the Fallen, the results of which are set forth in a paper read by Mr. A. O. Charles (Secretary of the Union) at the Glasgow Social Science Conference.

The proceedings were commenced with prayer by the Rev. Thomas Nolan, Incumbent of Regent-square Church.

Mr. Hanbury, M.P., after some preliminary remarks, read extracts from letters received from the Rev. John Davis, Ordinary of Newgate; the Rev. J. Lingham, Rector of Lambeth; Rev. T. Richardson, St. George's-in-the-East; and the Rev. A. J. Ram, of West Ham, on the causes and extent of the evil; from the Right Hon. the Earl of Shaftesbury, the Rev. W. Brock, of Bloomsbury, and the Rev. J. H. Gurney, of Marylebone, and several others, approving highly of female missionaries to the fallen; and from the City Chamberlain and the Rev. E. H. Bickersteth, of Hampstead, as to additional efforts required to meet the necessities of the times. He stated, also, that through the agency of this mission 369 cases had been received into approved institutions, and grants had been made unto them to the extent of 617*l.*

Mr. A. O. Charles (the secretary) then read a statement on the present position and prospects of the Mission, the peculiar feature of which is, that women of tried Christian character are employed as the agents for visiting the unhappy objects of the Mission at their own homes, and otherwise appealing to them individually.

The general subject was then discussed at considerable length. Mr. Hanbury, M.P., replied to various questions which were raised with regard to the objects and operations of the Reformatory and Refuge Union. Information of a deeply painful character was communicated by some of the speakers, while others bore gratifying testimony to the value and effectiveness of reformatory effort. The proposal for making Christian women the active agents in this new mission met with warm and unanimous approval, and various practical suggestions were thrown out with regard to the character and duration of reformatory discipline. Among points incidentally touched upon were the need of more Christian supervision of females in domestic service; the preventive effect of industrial training founded on sound religious instruction; the possibility of establishing boarding-schools for girls of the lower class; the demoralising tendency of various cheap places of amusement, especially on boys and girls, and of French novels and other current literature on the young of the upper classes; and the valuable influence of the Young Women's Christian Associations, of which two have now been established in London. The conversation closed with a resolution in favour of the scheme for increasing the number of missionaries to twenty. Thanks were voted to Mr. Hanbury for calling the meeting, and the proceedings closed with the Benediction.

Law Amendment Society.—A paper will be read in this Society on Monday evening, the 17th of December, at eight o'clock, by Mr. Edward Webster, "On the expediency of carrying into effect the sentence of death in the presence of official spectators only, and on a substitute for capital punishment." The subject, which has been much before the public of late, is expected to be fully discussed at the meeting.

Miss Martineau on the Sewing Machine.—The annual money value of the sewing required by the American nation that can be done by the machine is estimated at fifty-eight millions of pounds sterling; and a large proportion of the saving is already made by the sewing machine. In the city of New York alone, the annual saving is a million and a-half on the clothing of men and boys. The same amount is saved in Massachusetts on shoes and boots alone. The machine has revolutionised about forty distinct branches of manufacture, besides creating new ones. Here lies the solace of the poor needlewomen.—*Once a Week.*

THE THIRD ANNUAL REPORT OF THE COMMITTEE OF THE LADIES' SANITARY ASSOCIATION.

THE Committee, in presenting their Third Annual Report, have gratefully to record continued progress of the Association. While a review of the past year shows very many of the difficulties and failures necessarily incident to all new undertakings, the Committee humbly and gratefully believe it shows also enough of success and usefulness to prove that their work is of God, and that He is still with them in it.

The receipts of the last year are much greater than those of the preceding one, and one hundred and fifty-six new members have been added to the Association. The Committee rejoice to believe that this increase is not one of mere names and money, but in very many cases an accession of earnest and devoted workers, anxious personally to aid in the prosecution of the Association's plans. The Committee believe this not only because of the kind practical aid and valuable suggestions which they continually receive from many of the members, but because most of the rest who are personally unknown have joined the Association under circumstances which prove their membership to be a spontaneous result of devotion to the work. It is certain that for the Association to be really efficient it must be not merely a working centre supported by subscribers, but a body composed of active members, and the Committee are glad to believe it is really becoming so.

Though the title of the Association has been altered from "The Ladies' Association for the Diffusion of Sanitary Knowledge" to its present more comprehensive one, in indication of the Committee's earnest wish to do actual sanitary work, as well as diffuse knowledge, they have hitherto devoted their efforts almost exclusively to the promotion of the latter object. They believe that for the present the Association can do more widely extended good by arousing mind and conscience to the consideration of the sore physical evils which prevail, by diffusing a knowledge of the laws of health, and by pointing out the causes of disease, so that the poor and their friends may make intelligent efforts for their removal, than it can by a more direct course of action.

The Committee have continued the preparation and publication of sanitary tracts. The following have been issued since the publication of the last Report :—

10,000 "Cheap Doctor." (2nd Edition.)
5,000 "Health of Mothers." (2nd Edition.)
5,000 "Massacre of the Innocents." By the Rev. Charles Kingsley.
5,000 "Power of Soap and Water."
5,000 "When were you Vaccinated ?"
5,000 "How to Manage a Baby." (2nd Edition.)
4,000 "Health of the Parish." By Doctor R. Druitt.
1,000 "Worth of Fresh Air."
1,000 "Influence of Wholesome Drink."
1,000 "Advantage of Warm Clothing."
1,000 "Use of Pure Water."
1,000 "Value of Good Food."

In all, forty-four thousand, making a total of seventy-six thousand five hundred tracts issued by the Association since its commencement.

These tracts have been widely circulated throughout the country. A large quantity have been gratuitously distributed by the Association. Many clergymen, district visitors, and other labourers among the poor, have testified to the utility of the tracts, and are now constantly lending and distributing them in various ways. They have been found especially useful by the conductors of mothers' meetings. Other ladies have placed those tracts relating to infant management in the boxes of linen lent to poor mothers by Dorcas Societies. Others have placed them in lending libraries. Upwards of two thousand have been given by the managers of the Infirmary and Lying-in-Hospital at Manchester to the poor mothers in those institutions. In the Children's Hospital in Great Ormond-street, also, the tracts on infant management are given away by the head physician. In all cases within the knowledge of the Committee the distribution has been attended with satisfactory results.

There have been many very gratifying proofs that the tracts are appreciated also by the poor themselves. The Rev. J. Rowsell, the incumbent of a thickly populated district in Stepney, said in a public speech: —"These tracts have been circulated by us, we continually circulate them; and at the present moment there are none which are so eagerly asked for by our poor as these. A noble lord, a member of the Upper House, sent me a large number of them; and they are the very first things that are asked for whenever our district visitors go into the houses of the poor." The manager of a library for the poor writes, "Your books are the most useful we ever had." A conductor of a mothers' meeting states, "I created quite a 'sensation' the other day among my poor women by reading the 'Cheap Doctor,' and now I find quite a reform in the whole court in the matter of fresh air. I now let my Bible-women sell your tracts among my poor, and they buy them eagerly." Another lady states, "I went to give my usual reading lesson in our village school a few days ago, and, by way of variation, I set the children to read the 'Cheap Doctor.' I never heard them read with so much zest and animation, and the result was, that nearly all brought a halfpenny the next morning to buy a copy of the tract." A district visitor in Brighton states that a woman in her district has through reading the "Cheap Doctor" removed into a new lodging, where she can have pure air. One poor shoe-maker has testified his attachment to the Association by writing a tract for it, and he is now writing another upon what he touchingly calls "Domestic Management under Trying Circumstances." A poor woman recently called at the Association's office to beg the assistant-secretary to prepare a tract on the injurious effect of long hours labour in the city dressmaking establishments, and offered herself to write out a sketch containing facts from her own sad experience.

Other cases prove that the tracts benefit many beside the poor. The recent establishment of a swimming bath for ladies, in Brighton, partially in consequence of the tract entitled "Why do not Women Swim?" is one example.

Many other facts proving the utility of the tracts have been communicated to the Committee. They take this opportunity of earnestly requesting those friends who may circulate the tracts with satisfactory results, kindly to communicate them to the secretaries. A knowledge of them would be highly encouraging in many ways.

It is gratifying to know that the tracts —incomplete and few though they still are—have been the means of directing the attention of philanthropists in other countries to a new means of promoting sanitary reform. The following extract is from a lady of high social position in Hungary :—

"I have been most agreeably surprised by these very useful tracts on the management of children. I assure you that I shall certainly do all I can to propagate the principles contained in them. The first thing I intend to do is, to translate the excellent rules laid down, and then to try to carry them practically out among the poor here."

One of the leading members of the medical profession in Amsterdam has promised to carry out the Association's plans in that city. Similar promises have been received from a lady in Hobart Town, Tasmania.

The Committee have experienced much difficulty in obtaining suitable manuscripts for tracts, and they take this opportunity earnestly to request their medical and literary friends to aid them in this part of the work. They have very great pleasure in announcing that Sir John Forbes, Dr. William Farr, Dr. E. H. Sieveking, Dr. Southwood Smith, Dr. John Sutherland, and Dr. Charles West, have kindly consented to act as an editing committee. One or more of these gentlemen now revise every tract issued by the Association.

It has been found undesirable to continue the arrangements formerly made for the publication of tracts in the "English-woman's Journal," and no connection now exists between the Association and the conductors of that excellent periodical, save the common bond of cordial sympathy

Digitized by Google

and friendliness which should ever exist between all true workers for social good.

The diffusion of sanitary knowledge by means of classes and lectures has been continued. A course of twelve weekly lessons on the laws of health was given to a class of ladies by Miss Catharine Johnston, at Westbourne-terrace, in the spring of this year. A class has been formed, under the superintendence of a medical gentleman, for practical instruction in Ling's system of educational gymnastics, and in the laws of health. This class is formed exclusively for female teachers in schools for the poor, to whom the instruction is gratuitous. The Committee feel assured that the introduction of this most perfect method of physical training into all schools would be an inestimable benefit, and they are now endeavouring to bring the subject under the notice of educators. Edwin Chadwick, Esq., has kindly promised his valuable co-operation in this part of the work.

The following course of lectures on sanitary subjects has been delivered, by the kind permission of the Council on Education, in the Lecture Theatre of the South Kensington Museum :—

Lecture 1.—By the Rev. John Armitstead, Vicar of Sandbach : "On Industrial Employments in Girls' Schools."

Lecture 2.—By Dr. Edwin Lankester, M.D., F.R.S. : "On Sanitary Defects and Medical Shortcomings."

Lecture 3.—By Henry Roberts, Esq., F.S.A. : "On Healthy Dwellings, and prevailing Sanitary Defects in the Homes of the Working Classes."

Lecture 4.—By Ernest Hart, Esq. : "On Dress and Social Habits in relation to Deformity and Disease."

Lecture 5.—By Dr. William Farr, M.D., F.R.S. : "The Arithmetic of Life."

A series of meetings and conversaziones, for the purpose of discussing the means of bringing the Association's efforts to bear upon the London poor, have been held in drawing-rooms and school-rooms in Curzon Street, Mayfair ; Kensington Gardens ; Agar Town ; Borough Road ; St. Giles' ; Kennington and Stepney. Some of these meetings were attended exclusively by district visitors and other ladies working among the poor, others by the poor themselves. Addresses were delivered by a lady of the Committee.

A lending library of books on all branches of Hygiene is now in course of formation at the Association's office. The few books which it already contains are eagerly borrowed.

The Committee are now endeavouring further to utilize the office by making it a *depot* for all good books on the various branches of public and domestic Hygiene. No books are sold there but those approved by the editing committee, or other equally high authority. Thus, purchasers are directed to the best works on each subject. At the office the Committee have also commenced the formation of a collection of specimens and models of new inventions contributing to sanitary improvement. These articles are shown to visitors to the office, who are directed where to purchase them, and much good has been thus done. The Committee feel assured that a complete collection of this kind would form a very efficient means of promoting their objects, and they earnestly ask the aid of their friends and of inventors in its formation. The reports and prospectuses of all associations engaged in work directly contributing to sanitary improvement are also being collected and registered at the office. In short, the Committee are endeavouring to employ every kind of means to make it a useful centre for the diffusion of sanitary information of all kinds. Already many inquiries are made there.

In the autumn of 1859 a member of the Committee established a branch in Aberdeen, under the title of the Aberdeen Ladies' Sanitary Association. Subjoined are a few extracts from its Report :—

"The number of enrolled members is about seventy.

"The chief work undertaken by the Society has been the diffusion of sanitary knowledge by means of public lectures and the press.

"The introductory lecture, on 'Sanitary Reform,' was delivered by Alexander Thomson, Esq., of Banchory. Two thousand copies of this lecture have been published by the Association for distribution throughout the city. The second lecture, on 'Fever and Fever Poisons,' was delivered by the Rev. Dr. J. C. Brown. This has been twice re-delivered. The third lecture, on 'The Influence of the Mind upon the Health of the Body,' was delivered by the Rev. Alexander Munro, Secretary to the Association. The Secretary has also delivered a course of ten lectures to the young people attending the Crooked Lane Evening Factory School. In these lectures special attention was directed to sanitary topics of chief importance to those of the auditors who intended to become nursery maids. Lectures have also been delivered in several neighbouring towns and villages on various sanitary subjects.

"In addition to considerable numbers of the Parent Association's tracts, the Aberdeen Association has circulated two thousand copies of Dr. Pairman's 'Counsels on Health,' and several other similar publications."

In January a Branch Association was formed at Brighton, under the title of the Brighton and Sussex Ladies' Sanitary Association. Subjoined are extracts from a letter from one of its secretaries :—

"The subscribers now number about seventy.

"The Society has aimed at a practical realization of the Parent Association's aims, in the following ways :—

"1st. By the circulation of sanitary literature. The Association commenced its work by making grants of the Parent Association's tracts to clergymen, district visitors, and to the town and the female town missions. Some pleasing instances of good resulting from this distribution have been reported to the Committee. The Association has appointed agents at East Grinstead, Worthing, Arundel, and Petworth.

"2nd. By holding cottage sanitary meetings in some of the worst parts of the town. These meetings have excited much interest among the poor, and have done much good by leading them to an intelligent consideration of the physical evils from which they suffer.

"3rd. By the employment of female sanitary missionaries."

In the present month one of the members of the Committee has established a branch in Oxford, with every prospect of success.

In conclusion, the Committee earnestly ask the aid of all friends of Sanitary reform. Though the increases in the funds during the past year have been considerable, they must be much greater still before all the various parts of the Association's work can be efficiently carried out The Committee earnestly hope, therefore, that an adequate increase of public support will be accorded to them, and in humble and grateful reliance on the Author and Finisher of their work, they pledge themselves to increased exertions.

KINGSWOOD REFORMATORY SCHOOL.

On Tuesday, Nov. 20, the second annual "Harvest Home" was held at this school, which is conducted in a large building erected originally as a college for young Wesleyan ministers by Wesley himself. It was purchased for its present use, for which it is well adapted, in 1852. The proceedings on Tuesday were, no doubt, pleasing to the friends of the school present, and they were evidently a source of delight to the boys detained there. The corn harvest, we were informed, was very satisfactory, a good crop having been well saved ; and the other portion of the ground appropriated as a market garden has also been very productive. The whole, we believe, has been successfully managed, and, after paying all expenses, there will probably be a good profit. The school itself is, we understand, in a much more efficient state at present than it has ever before been, and the improvement is to be attributed, in great measure, to the experienced master (Mr. Barker), who was appointed about two years since. As the system pursued there possesses some novel and interesting features we append an outline of it. We may premise that although each boy is treated as one of a number, and controlled by the general regulations of the institution, yet each case is separately studied, and a discipline enforced such as will meet its requirements, and based upon the disposition of the boy, his antecedents in crime, and the cause of his criminality. The first lesson taught is, that the Reformatory is not a place of punishment, but a school in which the boy will be taught to forget his old bad habits, associations, and companions, and be prepared again to enter the world. The next lesson taught is industry, to convince him that it is his best policy to pursue his work with regularity, which policy in most cases becomes a principle. The amount of labour required of each inmate is in summer 9½ hours, and 6½ hours on alternate days ; in winter about 6½ hours per day. Another lesson which was taught was, that pay should follow work. Accordingly, on every Saturday night, all amounts as rewards for

Digitized by Google

labour, cash sent by friends, &c., were paid into the school bank, and deductions made for fines for disorder, neglect of work, or disbursements for sweets, boot-laces, handkerchiefs, neckties, caps, knives, or any other authorised article drawn from the store. The master says, "I find Saturday night, with its opportunities for reviewing the operations of the week, checking wrong propensities, teaching the importance of industry and saving habits, of great assistance to us in our work." Rewards for labour range from 2d. to 6d. per week, according to age and industry, and some inmates, who have a sufficiently good character to allow them to take charge of a detached class when on the land, receive more, according to the responsibility of the position and the manner in which their duty is performed. Each inmate receives every day three hours' instruction, under a qualified schoolmaster, in reading, writing, ciphering, geography, and a general knowledge of common things. Sunday is a day of rest and devotion, without work or play. In giving rewards, two objects have been sought to be accomplished —one to deal with the boys as one of a mass, with whose good conduct his interest is identified, and the other to deal with him as an individual, the result of whose consistency will be reaped by himself. When a delinquency occurs, all privileges are suspended until the delinquent gives himself up, which he is sure to do before long. As a boy rarely attempts to abscond without informing some of his school-fellows of his design, it is a rule that "whenever an inmate absconds, the whole school are required to pay out of the bank one penny each towards the expense of his recovery." When free from serious offences for four weeks, the boys are treated to tea and cake. By these means the inmates keep a check on each other, and many delinquencies are prevented. If a boy is idle, he gets no reward; if he continues idle, his balance at the bank is reduced; next, all favours are stopped; next, task-work; next, reduce his diet; next, work during recreation hours; then, solitary confinement on bread and water, which is rarely necessary. Any boy without a bad mark for a month, has his name posted on the "Board of Honour," in the dining-room; when, if he has been there three months consecutively, he has a reward. Stealing and absconding are punished with solitary confinement, and if the offence be repeated, a whipping is administered. Minor offences are punished by fines. One boy who strikes or behaves unkindly to another has a heavy fine. A boy who betrays a greedy disposition, by drawing from the bank continually to the lowest point, has his liberty to draw withheld. No boy is allowed to possess money. It is a great point not to allow too much spare time to be on hand at one period. Amusements are paid for out of the bank. Appended to a fife and drum band is drill, which is most important, in causing prompt obedience, attention, and health. A relative may visit a boy once a month; boys are required to write to their friends once a week. The inmates are not always kept for the whole term for which they were sentenced, as, if the managers are satisfied with the conduct of a boy, they may obtain the sanction of the Secretary of State to his discharge at any time after he has served one-half the term. Upon their discharge, those who have no homes are apprenticed, or sent as emigrants, or placed in situations. Speaking of the result of the system, the master says—"After sixteen years of active and direct labour among juvenile criminals, I believe that, with proper and judicious treatment, 75 per cent. are recoverable. The great effort is to develope an upright, honest, and independent character—dependent only on God's help."

By the favour of the secretaries, we are enabled to furnish an abstract of the report which the committee have agreed on, and will soon publish entire:—"They say that the present season completes the eighth year of its operations, and whilst in that period it had passed through many changes, many alternations of hope and despondency, many failures and some great successes, they felt that the whole arrangements and condition of the school had never worn so encouraging an appearance as at present. Let them praise the Allwise Director of humble human efforts, and let them pray that His guidance might still be given to those whose hearts would lead them to the rescue of the children of ignorance and vice. As Reformatory Schools had been for many years progressing steadily in the appreciation of the country, it was not necessary to say anything to prove their usefulness, as that was admitted by all, and the minor objections which were formerly made to the working of these institutions had been amply answered by practical tests. No candid person now considered that Reformatories offered any premium to vice and dishonesty, by giving the youths who were committed advantages that they could covet. No punishment was so dreaded by youths of vagrant habits as steady, hard work; still, no discipline was so much calculated to root out their vicious propensities. Reformatories, then, with the kind example of good masters, cheerful reward for obedience, and the hope held out of a happy future, were generally found to subdue the most hardened. Neither could it be complained that dissolute and reckless parents, whose offspring were born to degradation and vice, escaped, by means of the refuge which Reformatories afforded, from the consequences of their own wrong-doing, as the efforts of Government and of the managers of Reformatories were directed to make the parents answerable for the wrongs they inflict on their children and on society by their own neglect. In all cases where it was possible parents were obliged to contribute to the support of their children in Reformatories, and the Rev. Sidney Turner stated at a meeting of the Reformatory Union, in February last, that a large aggregate sum was then raised from parents, amounting to about £500 a year from those in London, £400 from those in Liverpool, and from the whole country to between £2,000 and £3,000. The committee rejoiced that they were able to give a cheering statement of the general aspect of the Reformatory, which was in a satisfactory condition in the industrial departments, and the moral discipline of the boys. They had successfully cultivated the farm and garden of fourteen acres, five of them rendering wheat and oats, and the rest potatoes and other vegetables for the market, and for the use of the institution, with no other aid than that of the usual superintendent. The boys had also quarried stones, built large walls, laid drains and water pipes, dug large quantities of clay, and at length had succeeded in burning (with some extra help in the last) upwards of 100,000 useful building bricks. The committee felt that the success which had been achieved in carrying a new manufacture into operation, under many difficulties, with entirely unskilled labour and rough tools, had shown an amount of steady determination both in masters and boys, which was most satisfactory. The premises, also, were kept clean by the boys under superintendents, and they washed, baked, and prepared their own food, and made and mended their own shoes and clothes, as far as boys' labour could be turned to such work. There was an air of contentment and cheerfulness about the school, and the boys were healthy and happy. They worked hard, and in play-time thoroughly enjoyed themselves. Drums and fifes enlivened their time, active games were encouraged, and the most praiseworthy lads were allowed to cultivate small gardens for their relaxation. At the same time religious and secular instruction was not overlooked, and the boys who, for the most part, came in in a lamentable state of ignorance, had, for the most part, under good and careful training, acquired such knowledge as was essential to the working man, including Scripture and sacred history. The effect of the moral training might be estimated by the fact that there were at present but very few attempts to abscond; that there had latterly been no need of corporal punishment, or of the use of the cells for solitary confinement. There were in the institution eighty boys, varying from 10 to 19 years of age, and also varying very much in their habit and tempers, and in their previous modes of life. During the past year thirty-eight boys had been received into the school from Bristol, Birmingham, London, Flintshire, Cheshire, Derbyshire, Gloucestershire, Oxfordshire, Surrey, and Lancashire, and six boys had been discharged, three of them returning to their parents, one being apprenticed to a tradesman in Liverpool, one having been placed with a shipowner of Bristol, and one having been enabled to emigrate to New Zealand, he having conducted himself so well as to gain a premium of 15*l.*, most liberally offered by Mr. G. H. Bengough, as an annual donation to assist one lad, properly qualified, to emigrate. The present case was considered by the committee sufficiently hopeful to induce them to add a further sum of about 8*l.* to provide outfit, and to pay the expenses of emigrating to a colony so distant, but yet so desirable. They had the satisfaction of knowing that a large proportion of lads who had left the school were maintaining themselves respectably. Many had visited the institution, and expressed thankfulness for the good they had received there. The committee suggested to the magistrates that, when they committed lads under twelve, they should

Digitized by Google

sentence them for such a term as would enable the committee to keep them till they reached an age at which they could earn their own maintenance; boys should not leave a Reformatory under the age of sixteen years. The expenditure had been brought to the lowest possible amount, consistent with an efficient working of the institution. The average cost per boy was 21*l.* 16s. 8d., very considerably less than in some late years; still, as the number of boys fluctuated, the reduction must not be too confidently regarded as permanent. The committee were, therefore, very desirous of retaining all the kind aid they had had, and of improving their funds in every other way. To the great regret of the committee, the valued president, Sir W. Miles, Bart., M.P., had found it necessary to retire from his office, and they had resolved to request the Right Worshipful the Mayor of Bristol to become president *ex-officio*. Other changes in the committee were noticed. It gave the committee pleasure to acknowledge with best thanks the kindness with which Miss Carpenter continued to visit Kingswood, encouraging, advising, and giving aid to that school which eight years ago was established by her effort. "In conclusion," the committee added, "an acknowledgment is due to the great and untiring exertions of the superintendent, Mr. Barker; but in his praise the committee can say nothing more gratifying to him or themselves than simply to refer to his success, and to the proofs of love and willing obedience which have been shown towards him by all under his charge."

The proceedings on Tuesday were commenced by the boys being drilled, and marched to the music of their drum and fife band. They went through the evolutions in a satisfactory manner, and ultimately were formed into single file and proceeded to the dining-room, in which they took their respective seats in an orderly manner, and subsequently proved themselves to be very expert with the knife and fork. The repast was on a more than ordinarily liberal scale. A game at football was afterwards indulged in by the lads, with great gusto, and at a later period they were conducted into the school-room, which was prettily decorated, and where they were met by many well-wishers to the institution. Among those present were Mr. James Livett, of Cotham (in the chair); the hon. secretaries, the Rev. W. R. Lawrence, of Kingswood, and Mr. S. W. Browne, of Clifton; the Rev. E. Sandford, of Kingswood; the Rev. Jogguth Chundra Gangooly; Mr. J. W. Palmer, Hanham; Mr. W. Somerville, Bitton; Mr. C. Thomas, Woodcote; Mr. H. Cossham, Bristol; Mr. C. J. Lambert, and Mr. W. Budgett, Kingswood; Miss Carpenter, Red Lodge, Industrial School, Bristol; Miss Frere, Bitton, &c.

The Chairman, in his introductory remarks, alluded to the good which the school had accomplished, and said the boys would have reason to thank God for the care and attention that had been bestowed upon them there by those who most earnestly desired their (the boys') present and everlasting well-being — (applause). He called upon

Mr. Handel Cossham, who said he was sorry that that was the first time he had had the opportunity and pleasure of meeting the lads there since their excellent friend, Miss Carpenter, gave up the entire management of it. What he had seen had convinced him of the good the school was doing. He was pleased at the order that had been exhibited and the work they had done, and he could not help hoping that that would be the beginning of good days. He hoped they would not be discouraged if they had fallen, for perhaps others would have fallen also if they had had the same temptation. Let them not think that they could not rise again, for they could do so, and by God's blessing they would. A great deal, however, depended on themselves. He had great faith in their learning habits of industry, and was satisfied that if they went out into the world with a determination to earn their own living, and asked God's blessing upon that course, the same Providence would watch over them as watched over others, and they would be enabled to provide for themselves. Many of the noblest characters rose from a humble position, and had laboured under many disadvantages. However, when they went into the world they would be exposed to great temptations again, and it behoved them to be watchful to guard against these. Wherever they had felt that they had a weak point, let them guard especially against that; whatever had been their besetting sin, the peculiar temptation that had beset their path, let them guard against that particular sin, and ask God's especial direction and care, that they might be guarded against it. He had observed that a great temptation arose from drinking habits, and he warned them against these. The keeping from the path of vice was the only way of saving themselves from future falls and future vice. Much care had been taken of them there, and he did not know when he had seen a number of boys look better than they did; he did not mean to make them proud, but he must say they looked as though they were happy, and intended to be so. He did not know why they should not be, for he believed that the Great God and Father desired that all His children should be happy, and that He took as much interest in them as in the children of the Sovereign of the country—that He looked with an equal eye on all. He would encourage them in every effort to shake off vice, and to lead a virtuous and proper life. Besides the imparting industrial habits to them he laid stress on the religious education they were getting there, for he believed the latter to be the foundation of all elevation—that the fear of God was the beginning of all right doing, and that if it was not begun with that, all the rest would be a failure in turn. He alluded particularly to religious, and not merely doctrinal teaching. They had examples worthy of imitation, and he trusted that these would not be disregarded by them. Let them love God's Word, and prayer. He did not believe in the success of any boy without prayer, for the blessing of God was essential to all success. He next referred to the example of Dr. Livingstone, who, when a poor lad, was anxious to get on in life; he had to work as a piecer in a cotton factory, and with his first week's wages he bought a Latin grammar, and learnt Latin as he worked; he went to Edinburgh to attend lectures, and was then sent to college. He had prayed to God to open up his path, and He did so. Dr. Livingstone's success arose from his earnestness of purpose, from his industry, from his reverence for Divine truth, and from his constantly looking up for God's blessing. He did not believe they could all be Livingstones, but he believed every boy could be great in his position.

"Honour and shame from no condition rise."

Whatever they had to do let them do it well. Old Rowland Hill said a Christian cobbler should be the best cobbler in the parish. They could all be useful, and let them resolve hereafter to do something to benefit the age in which they lived. Mr. Cossham illustrated his remarks by relating several anecdotes, and he was most attentively listened to.

The Chairman said there were some prizes to be distributed, and he would ask the Rev. Mr. Lawrence (to whom the school was under great obligations for the constant and deep attention he paid to it) to distribute them.

The Rev. Mr. Lawrence then distributed the prizes, and in doing so addressed to the recipients appropriate, admonitory, and encouraging remarks.

The first prize went to a boy with whom severe means had at one time to be used, but who had much improved, and who was about to leave the school for Liverpool, to learn to be a mason. The next prize went to a boy who came to the school with a bad character, but who had not been punished since he had been there, and for the past fifteen months had preserved an unblemished reputation. Then there was a prize for general attention, and others for honesty, carefulness, cleanliness, and progress.

The boys sang in admirable tune a song entitled "Give me the spade, Old England's glory."

The Rev. J. C. Gangooly next spoke. He said, since he left India, three years ago, he had been travelling in America, and in this country, and could say that, although India was extensively populated by a race whose civilisation, and learning, and philosophy were admired by a great many learned men, yet there were institutions in these Christian countries that India did not possess. There was vice and crime in India as well as here, but here Christ was working, and when he saw our reformatories and hospitals, and other kindred institutions, he felt the truth of what Christ said, "Lo, I am with you alway," for in a Christian country He was working with His disciples towards the promotion of the welfare of the children of God. Even the sons of Brahmins did the same as the boys before him had done, and which had brought them there, but there was no such institution as that in India, or anything to check the boys in their wickedness. He told them that, to urge them to thank those friends who took an interest in a school like that, and to thank God that they were born in a Christian country, where such Christian institutions were supported. He further

Digitized by Google

alluded to the disparity there was between India and the Christian nations, and said it was Christianity which had given them such an institution in this counry, and heathenism which had prevented such an institution springing up in India. Referring to one of the mottoes on the wall, "Oh, God! unto thee do we give thanks!" he said the tears were forced from his eyes when he first saw it, because it was so novel to him; he had never seen such a motto on any wall in India. Let them carry that motto in their hearts, and show it to the world; let them live and deal among men in such a manner as though that motto was written on their hearts. Prayer was a beautiful thing indeed, but he cautioned them against offering conventional, unmeaning prayers. They should rather be silent than utter such. Their prayers should be hearty, fervent, and natural. In conclusion, he urged them to become better Christian men.

Prayer having been offered, the meeting separated.

THE GAOL OF NEWGATE.

The report on the moral condition of the great city prison during the past civic year has been presented to the Lord Mayor and the Court of Aldermen by the Rev. John Davis, the Ordinary. In the opening of the Report, the Ordinary expresses his satisfaction at the intended reconstruction of the women's side of the gaol on the separate system of imprisonment. The prison authorities have now had, in the men's side of Newgate, full two years' experience of the effects of that system, both on great offenders and on those committed for minor misdemeanours; and that experience results in decided advantage over the many years of indiscriminate mixture of prisoners. The fears of suicide and lunacy, he says, have vanished; careful superintendence having prevented any attempt at the one from being successful, and not allowed the other to advance so far as to injure the intellect. The great benefit derived from the change has been the protection of the youthful criminal from further pollution. The refractory apprentice or dishonest errandboy, he says, can now be sent to prison without being irretrievably ruined, and punished without being defiled and corrupted. Besides, he suggests, the separate system enables a careful observer to distinguish very nearly what can and what cannot be done with crime. He compares crime with cholera. For crime, he says, there is no known effectual cure in all cases, but a vast deal may be done to prevent its inroad. Vain is the hope to expect its entire extinction. Every session reveals such lamentable instances of moral degeneracy, that if it were not checked by the criminal law society would hardly be secure. He thinks it would not be advisable to lessen to any extent the punishments inflicted on this class of offenders, lest crime should increase, and the tenure of property be made less secure; but he should wish to see the magistrates of the different counties, metropolitan and others, treat prisoners confined in the Houses of Correction in the same way the Government deals with prisoners sentenced to penal servitude, so far as respects the measures taken for the reformation of their minds, the judicious employment of their time, and the making the imprisonment a punishment. Men, he says, under penal servitude have a severe period of separate confinement to pass through for twelve or sixteen months, and that, with the daily religious instruction given them, is enough to bring them to serious thoughts of their folly and wickedness, if anything will. Mr. Davis continues to say that it presents a monstrous contrast that so much reformatory care should be taken where, in many instances, the cases are hopeless, from the long-continued habit of crime; and so little to the same effect carried out when the hopes of benefit are so much greater. Convicts and men under penal servitude have made great progress in demoralising habits. They are not thought unworthy of rational and humane treatment, with hopes of reformation and being restored to society. Why not, he asks, begin with such a system? When the convicts have completed their day's work they have a separate sleeping apartment, and opportunity given for retirement and meditation. Large numbers reform under such treatment. He does not know the proportion, but it is very large. Seven out of eight of all their prisoners never return to Newgate; and the ticket-of-leave men who are sent back do not reach anything like that proportion. The relapses of these men make a great noise, and they are, generally speaking, men of deep depravity; but that, he submits, is only an argument to give such persons longer sentences; it does not reach the mass of liberated convicts. Were such a system adopted with regard to first offenders and men out of respectable families, a very large proportion would be restored to society, and every one be benefited. There are a few prisons where much that is done by the Government is done by the magistrates. Reading Gaol, Aylesbury, Northampton, Leicester, Wakefield, Holloway, and others adopt a similar system, but without the variety of labour or regular payment for their work. With regard to men habitually addicted to crime, who make a trade of it, and who are lost to shame, all light punishments are nonsensical. The heavier and longer the punishment the better for all parties. There is a tedium about long sentences that wears upon the patience of that class of offenders, and often deters them from pursuing a course of crime when better and higher motives are wanting. Mercy in punishment, he says, should be mercy to first offenders, or it is no mercy at all; and, as an additional reason for urging long sentences on habitual criminals, he states there are among them some who seem equally incapable of reformation, whether treated strictly or mildly. The mixture of these persons with others, even in the advanced stages of their servitude, is always dangerous. Led by the advice of such, less experienced men on their liberation by ticket-of-leave have fallen into such new associations as have speedily drawn them back again into crime, and made them forfeit the privilege of being again among the free. The liberation of men after a number of years' imprisonment by ticket-of-leave is on the whole a system that answers well; but where offenders belong to the class of incorrigible delinquents they are formidable and dangerous to mix with others, and as a measure of precaution they should be kept by themselves, and never set free till there are moderately sound hopes of their reformation and purpose of amendment. He next adverts to the beneficial effect of religious instruction on men in separate confinement, and then offers some suggestions with respect to liberated prisoners. Too many of these, he says, leave prison in a much better state of mind than they continue long to possess. The loss of character sometimes makes the day of liberty the darkest in their lives. They come back to their desolate wives and families only to add to the burdens that already press them to the earth. Some of these do not return again to labour, but become permanent mendicants. There is much of this in the metropolis, and the kind and humane feeling of the day fosters it. But a little help just to set these persons going is very serviceable where the purpose is good and there is a moderate hope of success. Among the young very much may be done; separating children from depraved, vicious, and dishonest parents has a hopeful tendency, and reformatories answer so long as the purpose of the *protégé* is good, but there are many, very many, relapses into crime among them that have been so helped. The sooner and steadier a liberated prisoner gets into regular work and keeps to it, the greater the hope; too much nursing does not suit these men. They have made their difficulties by their crimes, and in the providence of God they must be prepared to meet them; no good is to be done to these men, except where their purpose of mind is to do right. The reverend gentleman remarks, in conclusion, upon the unabated perseverance in Post-office delinquencies. Remedies, he observes, against this species of dishonesty, are not to be looked for in the prison, for no better behaved men than convicted postmen can be found in any of the gaols. He suggests that much good might be done if the Post-office either positively refused to convey coin in a letter or made the price of a Post-office Order for sums not exceeding 10s., one penny. Whether, he adds, assistant-postmen are paid sufficiently (11s. or 12s. a week is a small sum), or the needlessly excluding old servants from receiving Christmas-boxes is wise or not, may be questioned. But there cannot be less than 100 servants of the Post-office at this time under penal servitude; and let benevolent persons just think of the homes, families, friends, and hearts of these men. Theirs in shame and punishment is the happier condition, for necessaries are provided; while their wives and children are in wretchedness or poverty, in the hospital or workhouse, as the unavoidable result of their crime.

INDUSTRIAL TRAINING SCHOOLS FOR GIRLS.

The subject of Industrial training for girls of the labouring classes is one which merits the earnest attention of all who are anxious to improve the condition of these classes; to raise the standard of national morality; and, to urge a more selfish consideration, of all householders who are desirous of having good and conscientious servants.

Conceiving that the subject may be appropriately noticed in the pages of this periodical, I propose now to describe three of these institutions, which are in full activity at Brighton, and to point out some of the benefits which, I doubt not, will eventually arise out of these and similar establishments; not only to those young girls who enjoy the privilege of being trained in these useful institutions, but also to the persons who employ them as domestic servants, and, in the case of their marrying, to their husbands and families, by the formation of habits of cleanliness, order, and economy.

I shall begin with the "Diocesan Institution for Training Servants," founded in 1836, and now located at Agnew House, Montpelier-road North. I have been over this establishment, and can testify to the general excellence of the arrangements.

On presenting myself at the Institution, the door was opened by one of the pupils, neatly dressed in a pink pincloth, which nearly covered her frock, and a clean and very neat white cap with muslin borders. By her I was ushered into a parlour, where I was soon joined by the matron, under whose escort I visited nearly every part of the house. The front and back parlour thrown into one is the schoolroom, or common sitting-room of the girls, about twenty of whom were seated round a long table, and engaged in needlework. Their dress resembled that of the one who had opened the door to me, namely, pink pinbefores and white caps. They rose on my entrance, but did not discontinue their employment. I was informed that they not only cut out and make their own clothes, but also take in needlework.

Leaving this room, I was conducted up stairs to the sleeping apartments, which occupied the upper floors of the house. Every window and door was open, and a brisk circulation of air was also kept up by opening a communication between the front and back rooms. Every girl had her separate bed, which looked clean and comfortable. A large attic was fitted up with basins, &c., as a washing-room. Descending the stairs, I was shown into a back kitchen, used as a laundry and bakehouse. Here were several girls engaged in folding linen, which they had washed and dried that morning. These girls were without the pink pinbefore, which, it seems, was only worn by those engaged in needlework. They are taught to iron and to get up fine linen; also to cook in a plain way, to make and bake bread, and to do household work. The girls take these employments in rotation, and are exercised in them three months at a time. When properly trained, they are placed out in service.

The children are admitted at the age of twelve, or earlier under peculiar circumstances; and it is the wish of the directors that each girl should be confirmed and receive her first communion before she leaves the establishment. The Institution is supported partly by subscriptions and donations, and partly by payments made on behalf of each girl, at the rate of four shillings and fivepence per week for each child, payable quarterly, and in advance. She will be required to bring with her a good stock of clothes, a list of which may be obtained at the Institution, and, after the first year, an additional sum of two pounds annually must be paid to keep up the stock of clothes.

The girls are much in request as domestic servants, but subscribers have a prior right of selecting servants from among them, and those girls who conduct themselves with propriety in their situations have the privilege of returning to the Institution on all occasions of perplexity and distress, and of remaining there until they have secured a fresh place, upon payment of four shillings and sixpence a week. An excellent arrangement this, considering the dangers and temptations which beset young and inexperienced girls out of place, even where they are so happy as to have parents to whom they can return.

At the present time thirty-four girls are boarded and educated at Agnew House, and during the last year nine were placed in situations. I may mention that I know an instance where the place of one who married while in service was supplied by another from the same Institution; a clear proof that the first had given satisfaction.

Since visiting these establishments I have seen another on a smaller scale, carried on entirely at the expense of a gentleman, who, amid the imperative calls of a large mercantile concern, finds time to occupy himself in relieving the sick, in protecting the orphan, in promoting the comfort of his workmen by the erection of improved dwellings properly ventilated and supplied with pure water and gas, and who is always ready to aid any attempt at social improvement.

The small Industrial School above-mentioned* is located in a new house in Market-street. It contains a small entrance hall, a kitchen and washhouse, and parlour; above are two bedrooms, one for the matron, the other containing three beds for the three girls, who, with the matron, constitute the establishment. All the rooms are properly ventilated. The windows are made to swing on a central hinge, opening above and below, so that they can be kept open in wet weather without admitting the rain. The lower panes are fitted with corrugated glass, which renders blinds unnecessary. Gas is laid on in all the rooms.

The principal apartment in the house is the kitchen, which is fitted up with a large range, on what, at first sight, appears too expansive a scale for the size of the house and the small establishment. The range contains an oven, in which bread is baked, a boiler, and hot closet for drying cloths. There are also laid on gas-pipes, to which a small cooking apparatus may

* Besides this Industrial School the same gentleman has also established another in the eastern part of the town, where six orphan girls are brought up.

be attached at pleasure, thus effecting a great economy in firing. The floor is inlaid with coloured tiles, and the centre covered with cocoa-nut matting. The shelves of the dresser are filled with enamelled metal plates and dishes, more durable than earthenware, and on the upper part are three or four dozen of grey enamelled pannikins, holding from a quart to three pints each. The use of these I shall now explain.

Mr. C—, with the good judgment which guides his benevolence, thinking that to poor patients just recovering from sickness, especially from fever, good food will do more than medicine; thinking, also, that food well cooked will be much more efficacious than a larger quantity ill-drest, instead of giving money to buy meat, which is most likely to be spoiled by bad cooking, fills up an order in a cheque-book prepared for the purpose, ordering the sick person to apply to the matron of the Industrial School for a pint of beef tea, or a dinner, as may be most suitable to their condition, three times a week for a fortnight. The food is varied, sometimes mutton or beef, sometimes calf's head; but it seems that the meat most relished by the sick poor is a slice of roast pork. The beef-tea is made on Soyer's plan, and to economise time, the meat is reduced in a few minutes to shreds by being passed through a small sausage-mill fixed on the table, and turned by a handle like that of a coffee-mill. After five minutes' boiling with water, the beef-tea is made. When the meal, be it beef-tea or more substantial fare, is ready, the entrance to the kitchen is closed by a half-door, on the outside of which the different persons wait to be served with their can of broth or meat. Thus the sick poor are provided with an excellent meal, and the girls have an opportunity of learning how to cook. In the course of one year upwards of 800 dinners were thus given away.

The girls selected to be brought up in this Institution must be orphans of both parents, and, if there be any difference, the best-looking girls are selected, on the principle that the pretty girls are exposed to greater temptations than the plain ones, and are, therefore, in more need of protection. They are received between the ages of ten and thirteen. They are maintained until they are qualified for service, when an outfit is given to them, and a situation found. Afterwards, if they leave their places from sickness or accidental circumstances for which they are not to blame, the house in which they have been brought up will always be to them a home.

The girls are neatly dressed, without caps and without any special uniform. This I consider an advantage, inasmuch as the formal dress carries with it an impression that the wearer is the recipient of charity; and, how grateful soever she may feel towards her protectors, it is not possible to avoid a kind of repugnance at parading her state of dependence to all the world by wearing a livery. In my own experience I have found that the girls take the earliest opportunity afforded them, by purchasing their own cloths, of leaving off their "charity dress."

The "Industrial Home" for girls in Egremont-place was established in 1854, and was originally designed to provide instruction and employment, together with an industrial home for poor girls who are without the advantage of due parental care and support, and to train them for service or other suitable occupation. This plan, however, was only partially successful. It was found that the very poor were unable to appreciate the advantages offered, and the girls themselves, having been accustomed to the license of a town life, did not like the confinement and necessary restraints required by the orderly discipline of "the Home." It was then determined, that instead of admitting the girls gratis, a payment of three shillings and sixpence a week should be made for each, and the sum which the parents were unable to pay was to be made up by the additional subscriptions of the supporters of the Institution. A better class of girls, generally the children of deserving parents, now enjoy the advantages of "the Home." Up to March, 1856, thirty-four poor girls have been sheltered, clothed, and educated, and in most cases placed in situations; two only have been dismissed.

The building occupied as "the Home" is a private house in Egremont-place, lent for this purpose by a benevolent lady. The Institution is supported principally by subscriptions and donations. It is managed by a matron, who is accountable to a superintending committee. The girls are taught household work, also to cook and make bread; to make, mend, wash, and iron their own clothes, and when the active work of the day is over, a teacher instructs them in reading and writing. Thus wisely in this, as in all the before-mentioned institutions, is book learning made subservient to the acquisition of that more valuable instruction which qualifies the girls for fulfilling the active duties of life. Plain needlework is taken in at "the Home," and an infant nursery, in which the girls were initiated in nursing, was at one time attached, but has been discontinued for want of funds. Each girl has a separate bed. The number at present in "the Home" is sixteen. The girls may remain until they are qualified for service, and if they behave well are sure to obtain situations. Indeed, they are so much sought after that they rarely remain long enough at the institution to complete their industrial education. At one period they were also in great request as temporary servants to persons of known respectability, but the practice of sending them out for short terms of service has been discontinued. The person hiring a girl for a short time paid two shillings or half-a-crown a week, one half of which went to the Institution, the other was placed to the account of the girl, and appropriated to the purchase of her clothing when the time came for her finally leaving the establishment. By this arrangement the girls had not only a present interest in behaving well, but they begin early to learn the pleasure of earning money, and were laying the foundation of thrifty habits. If the little weekly servant did not sleep in the house of the lady who hired her, the teacher used to escort her in the morning, and to call for her in the evening, so that she was not permitted to walk through the streets alone. The girls wear a kind of uniform, grey tweed dresses, and white caps indoors, to which are added straw bonnets and purple capes for out of doors costume.

Of the value of this Institution I can speak from personal experience, having employed some of the girls brought up in it as temporary servants. One, indeed, who was only fourteen years of age when she came to me, gave me so much satisfaction that, in spite of her youth, I engaged her permanently. She was in my service nearly two years, during which time she placed money in the savings bank, after finding her own clothes, which I assisted her to purchase and to make. She was removed by her friends, who had left Brighton and wished her to reside with them. I could mention, were it necessary, other instances where the girls have gone into a family for a few weeks, and have remained altogether. By a judicious regulation, the girls who are in service, and who conduct themselves well, are permitted to keep up their connection with "the Home" after they leave the Institution, to visit there occasionally their former associates, and to benefit by the advice of the matron.

It is true that my little maid had a great deal to learn, and that she required much looking after; but I consider her inexperience more than counterbalanced by her good conduct, steadiness, industry, and

Digitized by Google

docility. Besides, if the truth must be told, I have always preferred young servants to those more advanced in years—though I never before tried one so young as the little girl from the "the Home." Young servants fall more readily into the ways of the mistress, and have not as yet had time and opportunity to acquire some of the bad habits but too common with their class. From their youth and dependent situation, too, there is more sympathy between girls and their employers than between the latter and older servants. The mistress feels a responsibility for the well-doing of the girl, whose character may be supposed as yet not to be definitely formed. It is the duty of the mistress not only to instruct and advise her, but to preserve her from the contaminating influence of bad example. Hence, she will be especially careful that the character of the girl's fellow-servants is such that she may associate with them without danger of being corrupted. The mistress will also endeavour, by judicious kindness, to gain the confidence of the girl, and to convince her that she has her welfare at heart. On her part, a girl who possesses a good natural disposition, and has been properly trained, thus treated, will scarcely fail in becoming attached to the family, and will, in all probability, prove a good and faithful servant.

Considering how successful these Institutions have proved in training girls for domestic service, and also for the, perhaps, still more important offices of wives and mothers of artisans, it appears to me that it would be a general benefit to the community if similar training schools could be attached not only to town and rural schools, and orphan asylums, but to every workhouse and union in the kingdom. On the principle that prevention is better than cure, this would be good policy. It is much easier to train children to good moral habits than to reform those who have gone astray, and I hope the day will come when *Industrial Training Schools* will have superseded *Reformatories.*

At present a kind of stigma attaches to "a workhouse girl," I will not say whether deservedly or not; but I think that if all the young girls who become inmates of the workhouse received proper industrial training, and could, at a suitable age, show a certificate of merit and of good housewifery from the matron, they would not only be sure of good places, but would be actually sought after, not only as servants, but as "poor men's wives;" for it is an admitted fact that the schoolmistresses who have been educated in training schools as teachers soon become wives. The industrious classes have not been slow to perceive the advantages of moral training, and the formation of habits of economy and order, which they judiciously consider will promote the comforts of their homes. Would they not, then, be glad to meet with wives especially trained to housewifery?

Another advantage it appears to me would indirectly result from the establishment of these Industrial Training Schools; namely, that they would tend to raise the standard of qualification for domestic service generally, by compelling a large class of servants in want of places to make their own qualifications at least equal to those which under competent management might be possessed by "workhouse girls."

It would prove an excellent stimulus if a pecuniary reward were invested in a Savings Bank for every one of these girls who remained in her first place three years. One of the best servants I ever had was a young woman who had been brought up at the St. Patrick's Schools, in London, and who had received a prize of one sovereign as a reward for having been three years in her first place. Mine was her second place. She continued with me until she married, and she was so good a girl that I am sure she made a good wife. When I left London, now upwards of twenty years ago, I lost sight of her.

Allow me to add a few words more respecting "workhouse girls" before I conclude. Instances are unhappily not wanting where these poor girls have met with barbarous treatment from their mistresses, who ought to have protected them. It is true that the law provides that the guardians or overseers should keep a register of all young persons under sixteen years of age who are hired from a workhouse, and should cause them to be visited by the relieving officer twice a year, to ascertain that they are properly fed and treated with humanity; still, as we learn from the police reports, this legal provision is insufficient for their protection. As "workhouse girls" are now brought up, no mistress would take one into her service if she could procure other domestic assistance; but if the girls received proper moral and industrial training, persons of the better and more refined classes would be eager to engage them, and they would be so sure of good treatment that the relieving officers' duty, as far as they were concerned, would be a sinecure.

I need not allude to the effect which raising the character of the "workhouse girls" would have in diminishing the poor rates; that is so self-evident as not to need demonstration. M. P. M.

On the Treatment of Adult Criminals.

An Address given by G. Melly, Esq., at the first Meeting of the Liverpool Association for the Promotion of Social Science, November 22, 1860.

THE great attention which has been paid of late years to the dangerous classes, and the careful investigations both by the Houses of Parliament and private individuals into the state of crime in this country, has resulted in clearly pointing out that there are two distinct classes of criminals.

The *casual offender*, living in a respectable home, surrounded by respectable acquaintances, and in the enjoyment of an honest employment, but who, under the influence of temptation, has once violated the law; and the *professional criminal*, whose haunts are known to the police, whose companions habitually appear at our police-courts, and whose only occupation is felony. It is with the latter class only that I shall deal in this paper, and I shall confine my observations to the criminals of England.

There is perhaps no subject on which statistics are more difficult to procure, or less reliable when procured. The number of professed criminals in England have been variously stated at from 70,000 to 150,000; the police of this borough state the number of professed thieves of whom they have personal knowledge at 2,500—they compute at 1,000 more the travelling thieves who ply their avocation between Manchester, Birmingham, Leeds, and Liverpool—they have inscribed upon their books and visit from time to time 1,100 houses, the rendezvous, lodgings, or houses of this population.

I am fully aware that the peculiar circumstances of Liverpool, the density of its population, the moving character of its inhabitants, the vast influx of sailors, whose reckless behaviour and unsuspicious character cause them to fall an easy prey to the evil-disposed, our vast line of docks and enormous commerce, affording especial temptations, account in some degree for the appalling state of vice in Liverpool, scarcely equalled, I believe, in this or any other country; but we find, from the police reports of other towns, that the number of thieves well known to the police are sufficiently startling to justify us in inquiring whether we are dealing with the professional thief in such a way as to render the profession less remunerative and popular.

If it is difficult to obtain statistics as to the numbers of professional criminals, it is still more difficult to estimate the profits of their trade, and it must be re-

Digitized by Google

membered that the money which they spend represents but a small portion of the property which they destroy.

The late Rev. Mr. Clay, of Preston, states that in 1850 "there are many hundred pickpockets robbing at the rate of from 300*l.* to 1,000*l.* a-year;" and mentions, as the result of careful investigation, "that the cost to the police of fifteen pickpockets, during their career, was no less than 26,500*l.*"

An investigation, at the instance of the Liverpool Town Council, some years ago, by the late Mr. Downing, led to the conclusion that the annual contribution forced from the town by thieves was about 700,000*l.*; and the detective police estimate the robberies of our 2,500 professionals at 2*l.* 10s. a-week, say 400,000*l.* a-year.

We have, then, to deal with a population of professed thieves, amounting to, say 50,000, from which society is suffering to the extent of perhaps 5,000,000*l.* per annum.

The difficulty is, to devise a course of punishment, consistent with humanity, which shall either reform the offender, or tend to render him less dangerous to society; which punishment shall, at the same time, have the effect of deterring others from the commission of the said crimes.

Until within the last few years most of this class of criminals were sent to the colonies. In the thirty years ending 1856, the mother country was thus relieved of 77,000 criminals, who, in the course of time, through the means of employment afforded them, were absorbed into our colonial populations. We have learnt two lessons by transportation; first, that employment is the first agent of reformation—secondly, that in spite of the reckless and almost criminal management of our prisons, and the atrocious evils of our convict transports, there was a large majority of these 77,000 who *did* work when employment was offered them, who gave satisfaction to their employers, and who have become useful and industrious members of society. Determined not to make use of the experience which we have thus gained, and in the face of the condemnation of all the greatest authorities on the criminal question, we continue to condemn to short imprisonments our professed criminals; and year after year, after but a few months of incarceration, to turn out upon the world criminals whom we have not only failed to reform or terrify, but have rather irritated and hardened. Perhaps no act in our Statute Book has had a worse effect in increasing the number of short imprisonments than the Criminal Justice Act, empowering magistrates to deal summarily with certain cases brought before them; but it must be remembered that this Act was imperatively demanded by the difficulty, in many cases, of inducing witnesses to stay until the sessions or assizes came on, and, in their absence, of course the prisoner, even if guilty, got off scot free. This is peculiarly the case in Liverpool, where our seafaring population, in so many instances the prosecutors, cannot be expected from an abstract love of justice to lose their ships for the sake of prosecuting the offender. But even making all reasonable deductions, we find that the system of sentencing professional thieves to short imprisonments still largely prevails.

A few days ago one of the London magistrates, in sentencing a criminal who had been sent to prison sixteen times for three months, made this remarkable observation, "Then we will try what three months more will do."

In the *Times* of November 5th, Sir R. W. Carden, in sentencing John King, who had previously been convicted, said he had no doubt that the prisoner was at the meeting for the purpose of picking pockets, and had stolen the complainant's watch. He committed him for three months. The same magistrate committed John Davies, well known to the police as a thief, for three months, for picking a gentleman's pocket in the street.

At the Liverpool Quarter Sessions, on the 17th August this year, I find that out of seventeen previously convicted felons, ten were sentenced to six months' imprisonment, and at the sessions just held, out of thirty-three previously convicted felons eleven were sentenced for the same period. These persons, police experience tells us, go straight back to their old haunts on their release, rejoin their old companions, and recommence their nefarious career. In the words of one of our best detective officers—"Six months' imprisonment is no use at all for a regular thief." The utter uselessness of short imprisonments has been so conclusively proved before a committee of the Lords, and so completely admitted by all those who have any experience of the subject, that I do not care to quote any authorities; but I cannot help pointing out that the statistics of the London and Birmingham Discharged Prisoners' Aid Society seem to bear out my remarks. The London society offers assistance only to prisoners discharged from the Government prisons after long periods of imprisonment. The Birmingham Society deals with discharged prisoners of every class, and a comparison of the statistics shows that the success of the London Society exceeds that of the Birmingham one. Is not this easily accounted for? After a term of six years' imprisonment the discharged prisoner finds his companions dispersed, his home in these days of sanitary improvements perhaps levelled with the ground. For four years he has been stone cutting at Portland, or digging on Dartmoor, during which time, as Mr. Baker puts it, "if his heart has not become soft, his hands have become hard;" he has much difficulty in again finding a gang to work with, or in resuming his professional cunning, and the offer of assistance is readily accepted.

But it is not easy to find work for discharged prisoners. By our system of short imprisonments, on the one hand, and long imprisonments, enforced industry, and seclusion from temptation on the other, we have at least attained this result, that the community refuse, and wisely refuse, to employ the criminal or to absorb him among honest citizens without some guarantee of his reformation; and no certificates from governors, or schoolmasters, or chaplains of gaols, showing that the prisoner has behaved well in the absence of the power or opportunity to do otherwise, will, or ought to convice the public that they may safely receive him amongst them.

In other words, while the law, or rather its administrators, sentence a prisoner in defiance of all experience or common sense to an utterly inadequate punishment, society—refusing to recognise the punishment as sufficiently severe—imposes a far more terrible one.

We may rest assured of this, that until the treatment of our adult criminals is assimilated to that of our juvenile offenders, we shall neither touch the root of the disease, nor remove the prejudice on the part of employers against discharged convicts, which in some cases, may be said to force them back into a criminal life.

The Reformatory system which has been so singularly successful in regard to young thieves, is perfectly capable of being extended to all classes of criminals. A boy when proved to be of the felon class, without home or responsible guardians, is for the most trivial offence sentenced nominally to imprisonment for five years, practically, to be separated from the rest of society until he is supposed to be honest and wise enough, and skilled enough to mingle with it, without detriment to it or to himself.

"We have overwhelming testimony that juvenile criminals are reduced in numbers to an extent which—sanguine as I have always been in the efficacy of preventive and reformatory measures, if well devised

Digitized by Google

and applied with skill and with Christian zeal and perseverance—I never ventured to hope I should live to witness. Several Reformatories have actually been closed for lack of inmates, although established and conducted by those, whose interest in the work never decayed, and whose trust in the enterprise now grew faint. If any solitary remnant of that corps of sceptics who might, had we given ear to them, have disheartened us in the outset by their misgivings, still remains to be converted, let him ask respectable working men and their wives whether the steps of their children between home and school are so frequently dogged as heretofore by the 'city Arab.' Let him ask what has been the consequence of seizing the captains of the various gangs of juvenile depredators who heretofore harassed the passenger and the shopkeeper, and of sending these leaders, not to be confined for a week or two, and then let loose to join their followers in triumph, but to be consigned to a Reformatory for years; thence to emerge willing and competent to enter into some honest and useful occupation. The inquirer will assuredly find that the abstraction of the leader has caused the dispersion of the band; it being as true of a body of thieves as of any other body, natural or artificial, that the head is by far its most important member, and that, discouraged by its loss, the followers will slink away to their homes or hiding-places."*

Let the Acts 17 and 18 Victoria, cap. 86, section II., be extended to persons of *any age*, and the results which have flowed from the most sensible page of our Statute Book, will be repeated. I do not say that the reformation of the adult criminals will be as rapid or as enduring as that of the juvenile offender. The tares have had a longer growth, and will be more difficult to root up. The habits of intemperance, idleness, and debauchery, are no doubt far more engrained, and will take much longer to eradicate, but on the other hand, the cost of an adult reformatory prison will be reduced by the greater amount of labour which a man will perform when compared with a boy.

A five years' sentence sounds like an eternal punishment to a lad; to a professed criminal it is a time he can measure, a risk he has looked forward to; he has been "hit hard," that is all! Here, and here only, would I vary the nominal sentence of the boy, when awarding it to the man. As the "Akbar" youth is really incarcerated until he is fit to leave the vessel, and looks forward, not to the end of his sentence, but to the day when he can convince Captain Fenwick of his honest desire and of his power of doing well in the world, so in dealing with the adult criminal, the period of the sentence should be indefinite, and all should depend upon the criminal himself.

In the words of Mr. Matthew Devonport Hill,* "Keep your prisoners under sound and enlightened discipline until they are reformed—keep them for your own sakes and for theirs. The vast majority of all who enter your prisons as criminals can be sent back into the world, after no unreasonable term of probation, honest men, and useful citizens. Let the small minority remain, and if death arrive before reformation, let them remain for life." But it will be far more difficult to judge of the reformation of a man, than it is of a child, whose temper is less easily controlled, and to whom long-continued hypocrisy and deceit is more difficult. As the boy, therefore, demonstrates by his behaviour to his masters and comrades, by his application to his lessons, and by resisting the small temptations which fall in his way, that his school life draws near a close, so the man by his voluntary work, by his obedience to the rules of the prison, by his long-continued abstinence from luxuries and comforts, which he can have, if he chooses to pay for them, will prove to the prison officials that he need no longer be separated from the world.

The system of intermediate prisons in Ireland introduced by Captain Crofton, by which, during the last years of his sentence, a convict can by good conduct, obtain increased indulgence, amounting to almost perfect freedom, has had the most hopeful results, but we must remember that Ireland is in many respects an exceptional country. It is much easier for an Irish than an English criminal to procure employment, as owing to political events in the beginning of this century, the fact of imprisonment does not leave the same stigma which it does in this country. The success, however, which has attended the Irish experiment seems completely to justify the extension of the principle upon which it is based. Moveable and inexpensive iron buidings, economically located on the site of proposed works, accommodating fifty men and three officers at a cost of 330*l.*, have been proved eminently successful, not only in a financial, but in a reformatory point of view; and there can be no question that Captain Crofton, by the system of intermediate prisons, has been enabled to discharge numbers of reformed criminals. But although in the enjoyment of power, which no official is likely to obtain in England, and backed by the whole weight of the Lord-Lieutenancy office in Dublin, we still find that Captain Crofton is unable to deal with a large number of the convicts in his charge, whose conduct prevents him from passing them through the intermediate prisons. When the period of their respective sentences is at an end, he says, "they will be discharged to be the curse and peril of our land, if we are not sufficiently aroused by the magnitude of the evil, so to note them, as to materially assist in rendering their re-incarceration, with a much lengthened sentence, a matter of certainty at an early period, and thus render them, also, less noxious to the community."

Excellent, therefore, as Captain Crofton's system has proved, when compared with the English one of locking up our criminals in a stone palace, for a certain arbitrary period, and then opening the gates and turning them at once into the world to shift for themselves, it does not seem to be a perfect cure for the disease we are considering.

The mark system, proposed by Captain McConochie, involves the principle for which we contend. He proposes, that by marks given for personal good conduct, for diligent and efficient performance of different descriptions of labour, the criminal should purchase food, indulgences, and finally liberty. "A criminal," he adds, "who has forfeited his liberty through misconduct, may surely justly be required, besides maintaining himself, to purchase back his liberation by a proportionate period of good conduct." In other words, we simply ask that the professed criminal should be condemned to personal restraint until, by his good conduct, by habits of voluntary industry, and by resisting temptation, he has convinced his guardians that he is fit to take his place in the busy world, and that during the whole of that time he should maintain himself.

The cost of the prisoners in our gaols may be estimated at 25*l.* per annum, or 1s. 6d. per diem;* the present average earnings are about 3*l.* per annum, or 2¼d. per diem; and yet the age of 85 per cent. of our adult criminals ranges between 20 and 45, the precise period when the power of production ought to exceed the bodily wants.

When we look at the present enhanced price of both skilled and unskilled labour—when we consider how large a portion of the wages of the artisan is spent in, to say the least of it, unnecessary indulgence, and that the free labourer has in most cases a wife and family to support—we

* Charge of Matthew Devonport Hill, Recorder of Birmingham, October 8th, 1860.

* Page 265, Vol.: 1857, "Transactions of National Association."

* The cost of the prisoners in our borough gaol is much less than this. Last year it was about 15*l.* 10s., and the average earnings were 1s. 0¾d. per head per week.

Digitized by Google

cannot but arrive at the conclusion that, were they allowed to do so, the governors of our gaols could without difficulty, make our prisons self-supporting. The alternative presented to an honest man outside the prison who will not work is starvation, and the same alternative must be presented to the criminal within its walls.

From our prisoners, the amount of work required would be simply enough to pay for their maintenance in gaol, and every hour of overtime they voluntarily labour would bring the time of their release nearer.

An eminent statesman, who has had some years of experience in our Home-Office, suggested but one objection to this scheme of indefinite sentences accompanied by voluntary labour, namely—"that a considerable portion of our criminals would refuse to work, and that the public mind, with an excess of leniency, would refuse to allow them to starve."

To this I can but answer, that I believe the public mind is gradually awakening to a more rational view of its duty to itself and to its criminal population; be this as it may, the part of the social reformer is to point out the right path, and leave to the public at large the responsibility of refusing to follow it. I hold, then, that the adult criminal, the man whose profession is crime, should be sentenced to a fine of a certain sum of money, founded, not upon the offence for which he now stands at the bar, but upon his known character as a man whose occupation in life is felony. Any clever accountant, given the principle and the Statute Book, would easily make up a table of the fines to be thus worked out in industrial prisons. Nor should the scale be calculated upon a more severe basis than the sentences under the present system. The professed burglar caught in the act of house-breaking now receives a sentence of, say, four years' penal servitude, I would condemn him to maintain himself in prison until he had paid 62*l.* into the treasury. If he worked twelve hours a day he would be free in four years; if he worked ten hours it would take him eight years; by working eight hours a day he might maintain himself in prison as long as he liked; every hour less than eight he worked he would debar himself from some prison comfort or dietary indulgence; at five hours he would have reached bread and water diet; ,, five he would be losing his bed; with two hours labour he would lose the shelter of the prison roof, and if he idled all day he would pass the night in the prison court, without food, fire, or shelter.

I am not prepared, nor would the time permit me, to enter into the questions of detail which are involved in this proposal, but I do not believe that any practical difficulty would be met with while working it out. The clothing of our army and navy might employ thousands of able-bodied women in our prisons; while the able-bodied men of that large class, who having no employment but felony, figure under the head of "labourers" in our police statistics, could be employed in our harbours of refuge and other public works; nor can I see why the felon population of Birmingham should not be worked up into Armstrong guns or Enfield rifles; why the thieves of Manchester should not supply cotton shirts to our soldiers; or the criminal population of Yorkshire, blankets and flannel waistcoats to our sailors. Of course I may be met by the ancient and highly respectable protectionist argument that all these branches of labour are already overstocked, and that the Government has no right to compete, by means of felon labour, with the honest workman. I can but refer those who advance such arguments to the first principles of political economy, for if they are right, by a *reductio absurdum* it would be easily demonstrated that the wealth of nations consists in the number of felons which they support. It will be urged again that many of our criminals will be from constitution or physical circumstances, unable to maintain themselves in prison. If so, it would surely be better that they should reside in our hospitals, lunatic asylums, or workhouses, than that they should lead a wretched life in our prisons; if they must be supported by the public, let it be legally in our asylums.

One objection, however, may, in the present localised system of our police, prove fatal to the scheme of placing all our professed thieves under sentences of long imprisonment. By moving from place to place, they already contrive to appear in the different police courts of the metropolis, and of our provincial towns, in the character of "Not known here, sir!" and when the penalty has been enormously increased, they would take even more care to run no risk of a second capture in the same town.

Great are the benefits which have flowed from local government and local organisation; but in these days of rapid and cheap travelling, our police, detective, and prison system should be far more centralised than it is, and every criminal, let him be tried where he may, should come up on a second offence with his previous conviction, be it where it may, duly marked against him.

The ignorant bumpkin, or the foolish lad, who, under the influence of beer, or a quarrel with his parents, takes Her Majesty's shilling, and enlists in our army, is held so firmly pledged to that honourable career that if he deserts it he is branded with the letter D. Let the thief who, after solemn warning and six months' reflection, commits a second offence, and thus deliberately announces that he has chosen the profession of open war with society, be marked in like manner with the letter F, in characters as unmistakeable as the deserter from our army.

But we must guard against leaving it to one tribunal to decide on so severe a punishment as an indefinite sentence of imprisonment, lest through mistaken identity, or from any other cause, injustice should be committed.

If the question at stake be the title to an acre of land, or the ownership of a bill of exchange for 50*l.*, the case may be tried half a dozen times, before the most learned lawyers in the realm, but, if the question be one of imprisonment, transportation, or even life and death, it is left to one jury, to one judge, and if appeal there be, to an irresponsible Home Secretary.

I do but follow in the steps of all those who have written on the subject of our criminal procedure when I urge the appointment of a court of appeal in criminal cases. If space permitted, I would further urge how in all these cases the interests of justice would be furthered by the appointment of a qualified public prosecutor, with an efficient staff, in every large town or country district.

The position, then, that I take up is this, that there are in this country many thousands of persons whose profession is crime, and whose present existence is dangerous to society, that our present system of short and uncertain imprisonment, accompanied by compulsory and unremunerative labour, does not tend to diminish this class of persons; that our experience, whether gathered in our colonies during the old system of transportation, or in our reformatory schools under the Juvenile Delinquent Act, alike proves that, imprisonment practically indefinite in its duration, to be prolonged or curtailed at the will of the prisoner, and accompanied by voluntary and remunerative employment, has been eminently successful.

I propose that the persons who, having the right of appeal, have been proved to belong to the criminal class, should be confined in industrial prisons, till such time as by maintaining themselves, and by making good to the State the damage they have inflicted upon society, they have proved that they are worthy of their free-

Digitized by Google

dom. I believe that such a treatment of our criminal offenders would be in strict accordance with our social rights, would sin against none of the axioms of political economy, and, inasmuch as it affords the best chance of reformation, is founded upon truly Christian principles.

Reviews.

Charge of MATHEW DAVENPORT HILL, Recorder of Birmingham, delivered to the Grand Jury of that Borough at the Michaelmas Quarter Sessions, 1860.

MR. HILL'S charge has been reprinted from the daily papers in the form of a pamphlet by Arrowsmith, of Bristol. At a time like the present, when a manifestation of public opinion is called for on behalf of Ragged Schools, Mr. Hill's unprejudiced statement of their claims is not only valuable in the weight of its own authority, but also as furnishing plain and convincing argument to meet the prejudices of many excellent people who ought to be helping the cause, and are not.

It would surprise the zealous advocates and earnest workers of these schools could they know the strong feeling that exists against them. It is supposed that the children who attend them learn neither religion nor manners, a confusion between the condition in which the children first enter the schools, and that in which it is hoped and purposed they shall quit them, which both Mr. Hill and Miss Carpenter especially allude to.

Mr. Hill speaks of "the admirable system which is designated as that of Ragged Schools, a name which, being meant to indicate the state of the poor child on his entrance, has been mistakenly supposed appropriate to him during his whole stay; whereas it is felt by the teachers that no secular instruction can be so desirable as that which puts it in is power, partly by his own exertions and partly by the good influence which he learns to exercise over his parents, to come among his schoolfellows clothed in decent apparel."

Miss Carpenter says "Ragged Schools need not be, and ought not to be 'inferior schools,' but schools as good as others *in fitness for the end intended.*"

This prejudice against the training in Ragged Schools exists most strongly among many "religious" people, understanding by that term people of strict and decided religious opinions. If they could be convinced that every step against evil is a step towards good (if not good in the particular shape they feel to be best), they would cease to depreciate Ragged Schools; if only on the ground of social policy. Probably few people would hold their own creed firmly or live by it faithfully, if they did not believe it as true for all the world as for themselves; but there is ample scope for the development of this desire to impart what we feel *the* truth in hundreds and thousands of private and parochial schools; and if these were doubled and trebled still they, the Pay-schools, will leave work to be done among the "perishing and dangerous classes," which a broad public system, such as that of Ragged Schools, can alone meet.

Mr. Hill reminds the grand jury of the conference held in Birmingham nine years ago to consider "how best to combat the great and rapidly growing evil of juvenile depravity." That conference divided children of the vagrant classes into three classes, as did the American Congress held in New York last year, and for the first of these classes, the children who from abject poverty, or parental degradation, are *in danger* of crime, the remedial measure proposed was Free Day Schools, or what we call Ragged Schools. And the Government help voted to be necessary for these schools was "such an extension of the grants from the Committee of Council on Education as might secure their maintenance in an effective condition; they being at that time excluded from aid; yet, as we contended, requiring it in a far higher degree than those on which it was conferred." And besides this, "after deciding what we should wish to be done were our means equal to our desires, we had further to consider the nature and extent of these means. Popular assistance was indispensable, and that we know would only be afforded by popular sympathies."

It is now nine years since that conference, and at the present time juvenile crime has lessened beyond the expectations even of those who were planning and labouring for its prevention. Of the share Ragged Schools have had in this amendment, and of their claim on that popular sympathy which is most likely to influence the Legislature in their behalf, Mr. Hill's own words will best enable the reader to judge:—

"Gentlemen, in schools like that which I have described, even where not a single penny is expended in feeding the pupils, the cost to the subscribers is heavy. The teachers, male and female, must have peculiar and somewhat rare qualifications. They are not required to be either mathematicians or linguists. Their knowledge of geography may perhaps be limited and superficial. It is desirable that they should speak and write their mother tongue after the manner of educated persons. They should be able to practise and to teach a legible handwriting. They should be quick at figures, and competent to make their scholars as quick as themselves in solving the problems which arise in humble life. But all this does not go to the root of the matter. They must be of a patient, child-loving nature. They must possess the gift of influencing the hearts of their young flocks so that not only must they love, but they must inspire love towards themselves. That they must be honest and pious, I need not say. Furthermore, they must be numerous. Gentlemen, the class of children to which I have drawn your attention is the most difficult in the world to govern. To ordinary motives and expedients the master can seldom resort with effect. The parent who pays for his child shows by that act that he values what he will call schooling, and will lend his aid to the master to secure the attendance of his child; but the class to which I refer is not paid for. The instincts of the parent are sufficiently strong to induce him, after some rude fashion, to feed, clothe, and house his child. But there is no motive in his mind strong enough to compel him to pay for education. He has had none himself, or so little, and that little so repulsively offered, that he has derived neither pleasure nor profit from what he has received. He, therefore, instead of promoting the punctual and regular attendance of his offspring, throws hinderances in his path to school, and withholds him from instruction whenever his own interests, or his caprice, or the desires of the child himself so dictate. Again, it will be thought that the receipt of food at school would present an all-potent allurement. But, in the first place, the conductors act with regard to such a gift under the wholesome restraints which I have pointed out, and, in the next place, children of this class are inured to hunger and cold, and consequently often prefer their darling pleasure of wandering at their own will to the dinner, coupled as it is with the restraints of school. The result is that, imitating the policy of the Sultan of Turkey in regard to his African possessions, we must, to use the language of Burke, 'get such obedience as we can, and govern with a loose rein that we may govern at all.' Hence we have to depend on personal influence in school, which demands a staff of teachers sufficiently strong to prevent the influence of each being dissipated by attempts to exercise it over too large a number. Again, it must be remembered that in addition to the duties of the master in school hours, his labours are augmented by the necessity which exists for making inquiries of the parents as to truants, and endeavouring by argument and persuasion to ally himself with the former so as to strengthen his influence over the latter.

"Our conference, gentlemen, stimulated popular action upon the Government and the Legislature, and many of the changes for which we asked have been conceded. The Government gave liberal aid to reformatories by grants of money and by the appointment of a most able inspector, whose advice and supervision have been invaluable. Industrial feeding schools have also received the bounty of Government, and,

Digitized by Google

as I am told, that bounty is likely to be further extended, although I trust not to the detriment of reformatories. The industrial feeding school is a noble institution. The laws by which it is regulated owe much to the amending hand of our respected neighbour, Mr. Adderley, who is still earnestly bent on perfecting their provisions. This class of schools will, I trust, succeed in conciliating the favour of the magistracy of the land, whose assistance is much required for their development. In the present state of the Acts, hinderances no doubt stand in the way of their execution. These impediments have, however, in some places been surmounted, especially in the city of Bristol, which has been largely benefited by the alacrity with which the magistrates have co-operated with the managers of such establishments. But the position and prospects of the free Day School or Ragged School are, I grieve to say, far less encouraging. For a short period they brightened, and the Privy Council in a gracious frame of mind opened their hand. When we, profiting by the opportunity, and happily ignorant of its evanescence, enlarged our means of usefulness by extending and improving our schools of this description, then, alas! the hand closed upon us in all but utter denial.

"Gentlemen, I have felt compelled to occupy you with this long and I fear tedious explanation, in order to justify myself in urging the necessity for an universal manifestation of opinion, to the effect that, if public money is to be spent on education at all, the schools which I have now described ought to be the first objects of the public bounty. I, gentlemen, am no enemy to what I may call the luxuries of education. I am quite content to bear my share of that taxation of the country which maintains the British Museum and similar foundations, although, if you divide the annual cost of the British Museum by the number of visitors, enormous as that is, you will find each visit of each visitor costs the nation several shillings. I am glad to see schools of design spreading over the country, and I grudge not the expense; indeed, I should be glad to see it much larger than it is. But, nevertheless, I do say that, if I were called upon to defend such an employment of the revenue, I should not find my task altogether free from difficulty. Whereas, inasmuch as in the nature of things the people of every country must be governed, and as that government must be paid for from a common fund, if it shall be found that instruction and training, when applied to qualifying the recipient for performing his duties as a member of society, thereby reduces to a minimum the expense of governing him, then, and so far, I look upon education to be a part of government itself; and consequently, where the cost of tuition cannot be extracted from its natural sources, I consider it self-evident that it should be furnished by the State. Whether it should come from the Privy Council or from the Home-office—whether it should be charged upon the general revenue of the country or raised by local rates—these are questions into which I will not enter. But I stand upon the broad and irrefragable truth that, as the disbursement is called for by the interest of the State, by the State ought it to be borne, and I must unite my humble protest to the masterly speech of Sir John Pakington in Parliament, the fervid appeals of Dr. Guthrie, and the unanswerable remonstrance of Mary Carpenter against the huxtering frugality with which our Ministers let go their coin shilling by shilling to the Ragged Schools—a parsimony which, when contrasted with the plenitude of their munificence in favour of classes of the community able and willing to contribute to the education of their children, strikes me as the most astounding example of inconsistency which has occurred in my time."

Thorley's Illustrated Farmer's Almanack for 1861.

This Almanack, published by Joseph Thorley, 77, Newgate-street, contains more information of general interest than the title would indicate. The lists of fairs throughout Great Britain, the farming operations for each month, and the ordinary round of almanack intelligence, are interspersed with remarks on crops, animals, and machinery, which swell the pamphlet into a very readable little book. It may be said that the whole almanack is an advertisement of Thorley's Food for Cattle; but that does not affect the merit of the information it contains. Moreover, the account of the Steam Mills in the Caledonian Road, where this food is manufactured, is, in itself, very interesting, as all accounts of well done work are; and the extracts from contemporary papers in comment upon the Cattle Food suggest many ideas beyond the cattle and the food so highly recommended.

Among them is how much hand-labour ought to be in demand from those improvements in machinery, which both the uneducated class of farmer and the still more ignorant labourer suppose to be calculated to diminish it. The hand-to-mouth farmer hopes that every day's hire of machinery is to save so many day's hire of manual labour, and the labourers on his farm look with natural dismay at the steam giant who seems swallowing up a month's wages and a month's work in a day. Yet, in truth, there are as many hands wanted as ever, if the master knew where to employ and how to pay them, and if the men could employ what they consider their reasoning powers in executing improvements instead of in grumbling against them. Men of intellect and enterprise know this and act upon it, but these are the exception; and in how many agricultural districts does the small farmer starve his labourers, his land, his cattle, and, in the long run, himself, for want of energy and intelligence to economise his small capital? How many things are left undone on such a man's farm which would employ families he helps to support in the shape of poor-rates, and which things he would still hardly believe worth doing, could they be done for him without any expense at all? Among these cookery for animals stands prominent. It is a known fact that cows may eat turnips without injuring the flavour of their milk, provided the turnips are sound and clean, one decayed or tainted mouthful doing more to affect the milk than two or three meals of good roots. If the Steam Thrashing Machine sets a man free to wash, pare, and sort the fodder roots of the farm stock, it has done him no injury, only changed the nature of his work, to the benefit of the farm by which he lives.

Mr. Thorley appears to be the Soyer of Cattle-Cookery, and we think that any one after reading the account of his manufactory, and the testimonies to the results of its manufacture, will be inclined to agree with the statement of Cassell's *Family Paper*, that "Mr. Thorley is evidently an agricultural reformer, and is not only anxious to sell his food but to disseminate his principles."

The Social Science Almanack and Handbook for the year 1861. London: W. Tweedie, 337, Strand.

We are glad to see this Almanack in its second year of publication. As a Handbook of all that has been done and is doing in every department of Social Science it is complete. It contains the most concise and practical account of the late Congress at Glasgow that we have seen. The information in its pages is, however, not confined to the work of the National Association, but comprehends all that bears upon the promotion of Social Science in parliamentary proceedings, and the progress making by public and private societies in its development. Among the Almanack intelligence is a list of the public Offices, with the hours of attendance at them.

The Drains at Brighton.—The following letter appears in the *Lancet*:—"Two months ago I took a house in one of those fine eastern terraces facing the sea at Kemptown, Brighton. The abundant rain which had fallen probably prevented me from detecting any disagreeable smell at the time, and the agent, in reply to my inquiries, told me that the drainage was excellent. In the course of a fortnight, however, I began to be annoyed by foul effluvia from the drains, and soon afterwards the cook was prostrated with fever, and confined to her bed during a space of ten days. My children and servants sickened in succession, and were attacked with headache, sickness, and febrile derangements, clearly attributable to poison-

Digitized by Google

ous atmospheric agency. Examination showed that the drainage of the house was wretchedly imperfect. My youngest child did not, unhappily, escape so lightly as the rest of my household, and I have just brought her back to London, suffering from a most severe form of diphtheria, which I need not tell your readers arises almost invariably from bad drainage. I immediately wrote to the agent, and when stating the circumstances, warned him of the responsibility he incurred in again letting the house until the condition of the drains had been thoroughly investigated. In reply he stated, 'I have made every inquiry into the state of the drains and water-closets, and find them unobjectionable.' On receiving this stereotyped answer, I sought an interview with the late mayor, who is a fellow-practitioner, and asked his assistance. He told me there was no officer of public health at Brighton. He admitted the objectionable state of the drainage of the town, and told me he had been for years urging the subject on the attention of the Town Council, but in vain. As I could offer no evidence that the evil compained of extended beyond the house, he could not render me any assistance. I next appealed for advice to Mr. Simon, at the Board of Health in London. He told me Brighton had not put itself under the jurisdiction of the London Board. If an epidemic broke out, the Council could send a commission to investigate the subject; but in a case like mine he had no power, and, although he had on several occasions alluded to the bad drainage of Brighton in his report, the evil, he was well aware, still remained unaltered. Lastly, I appealed to Dr. Farr, at Somerset-house; he pointed out the following passages from a recent report of the Registrar-General:—'The mortality in many of the towns has been excessively high, and this has been notably the case in Brighton. To take one instance, the deaths (386) exceeded the births (377) in St. Peter's, Brighton.' The Registrar adds, 'The inhabitants of this sub-district are chiefly artizans, mechanics, and the labouring poor. In many of their dwellings a very insufficient supply of water has been available to them, owing to the dryness of the weather in the first portion of the quarter, the water in the wells in use having been very low. There is no effectual drainage attached to their dwellings, and the cesspool system is in general use.' In my communications with these gentlemen, I have met with much sympathy, but no redress; and more than one official authority has told me that for the latter I must appeal to public opinion through the press. It is, then, to assist the energetic local reformers, who are anxious to improve the sanitary state of Brighton, and render it one of the most healthy, and (as I believe it to be) desirable residences during the autumn months, that I appeal, sir, to you, even at the risk of damaging for the moment the pecuniary interests of the lodging-house keepers during this season, when the town is overflowing with fashionable society. All agree that as long as Brighton fills, and the profession recommend it as an autumn residence, the ratepayers will not incur the expense of making sewers in place of cesspools, nor will individual landlords even trap the old ones."

INTERNATIONAL EXHIBITION OF 1862.

The correspondence between the commissioners for the Exhibition of 1851, the Society of Arts, and the trustees for conducting the Exhibition of 1862, has been brought to a satisfactory conclusion, as will be seen by the accompanying letter, addressed to the Secretary of the Society of Arts. This correspondence has had relation to the site for the building, the provision of the necessary funds, the incorporation of the trustees by the authority of the Crown, and their relations with the commissioners for the Exhibition of 1851:—

"London, Nov. 22, 1860.

"Sir,—We have to acknowledge the receipt of your letter of yesterday, enclosing the copy of a communication from her Majesty's commissioners of the Exhibition of 1851 to the council of the Society of Arts, in which the commissioners express their general approval of the object which the society has in view in organising the Exhibition of 1862, and their willingness to render such support and assistance to the undertaking as may be consistent with their position as a chartered body, and with the powers conferred upon them by their charter of incorporation.

"Under these circumstances, we have to request that you will intimate to the council of the Society of Arts our willingness to accept the trust which the council and the guarantors have in so flattering a manner expressed a wish to repose in us, on the understanding that the council will forthwith take measures for giving legal effect to the guarantee, and for obtaining a charter of incorporation satisfactory to us.

"We have the honour to be, Sir,
"Your obedient servants,
(Signed) "Granville,
"Chandos,
"Thomas Baring,
"C. Wentworth Dilke,
"Thomas Fairbairn,

"P. Le Neve Foster, Esq., Secretary to the Society of Arts."

The guarantee list includes 662 persons, and the sum guaranteed now amounts to 366,800*l.* The commissioners for the Exhibition of 1851 have granted a site for the building on their estate at South Kensington.

Holloway's Pills.—Sceptics Silenced.—Many persons who have doubted the wonderful curative and purifying powers of these Pills, and afterwards witnessed the beneficial effect produced by them in diseases of the digestive organs, have been constrained to admit their efficiency, have adopted them as their own domestic aperient, and graciously recommended them to their friends. Holloway's Pills act primarily on the stomach, which they thoroughly invigorate. They then exercise a most wholesome influence over the liver, from which they immediately remove any congestion or temporary stagnation of the bile or blood. The discovery of these Pills was indeed a triumph in art! How much sadness and sorrow have they banished? Holloway's Pills have rescued thousands from habitual pain and confirmed ill-health.

A Good Family Medicine Chest with a prudent use has saved many a life; and yet we think the idea might be improved upon, and reduced to a more simple form. Take some good compound, such as Cockle's Antibilious Pills, and we find that the desired end may be obtained without scales and weights, or little mysterious compartments and enchanted bottles with crystal stoppers. Others might be used, but Cockle's Pills, as tested by many thousands of persons, and found to answer their purpose so well, may be set down as the best.—Observer.

A Cure for Mendicancy.—On the day fixed, orders being previously given, the police of Munich seized every beggar of every kind that could be found in the streets, and conveved them bodily to a large manufactory, the character of which was, in fact, that of a workhouse, with, however, the valuable addition of military discipline. Once secured within the New Military Workhouse, the beggars were washed, dressed, and fed; they were given free permission to stay or go, as they pleased; but a decree was soon issued making mendicancy a breach of the law, and ordering the gendarmes, throughout the capital, to arrest any one proved to have been begging. Othello's occupation was gone; the beggar, who dared no longer beg, was only too glad to eat the excellent dinner provided at the workhouse, and to do the work for which alone that dinner was the recompense. The work of classification was, of course, difficult. There were some genuine cripples, who were too weak for any work, and such were sent to the infirmary; others there were, who, afflicted with some permanent complaint, were capable of but little exertion, and for these light work was provided; but the majority were 'sturdy beggars,' who could work well enough if made to do so. No restraint was set on any of them. They were only warned that they would be taken up if they begged; and the only alternative was to accept the work offered them. Wages were paid to really worthy workers, and the dress and board was common to all. As a proof of the success of the system, it may be mentioned, that in five years' time the institution was realising nearly a thousand per annum. But what was that? The real glory lay in the fact, that a vicious, idle race of beings, who were numbered by thousands, even in so small a city as Munich, were gradually converted into honest workmen; were instructed in religion, and raised in moral character; while the citizens were relieved of what had been a tax on their purses and tempers alike.—*The Art of Doing our Best.*

The Results of the Penny Bank.—During the nine years the East Grinstead Penny Bank has been open, 1,960*l.* 2s. 1d. has been deposited by 1,046 individuals.—1st year, 121*l.* 7s. 8d.; 2nd year, 160*l.* 17s. 3d.; 3rd year, 190*l.* 13s. 1d.; 4th year, 187*l.* 4s. 11d.; 5th year, 214*l.* 11s. 1d.; 6th year, 266*l.* 13s. 3d.; 7th year, 223*l.* 12s. 9d.; 8th year, 270*l.* 7s. 11d.; 9th year, 324*l.* 14s. 3d. The number of deposits made during the past year amounted to 5,383, averaging 104 each sitting; of these 282 were deposits of one penny; 952, twopence; 746, threepence; 268, fourpence; 1,052, sixpence. Of the entire 5,383 deposits, 4,444 were sums not exceeding 1s. Besides being useful in a variety of ways, the Penny Bank has proved a stepping stone to the general savings bank; in the report just issued it is stated, "in nine years the Penny Bank has introduced to the general savings bank 322 new depositors." East Grinstead is a small agricultural town.

Printed for the Proprietors, by Woodfall and Kinder, Angel Court, Skinner Street, London; and sold by W. Tweddie, 337, Strand.—December 1, 1860.

STRONG DRINK.—A Parliamentary return has just been issued, moved for by Mr. Baines, showing for a series of years "the actual or estimated consumption of spirits" in the United Kingdom. The quantity consumed in the year 1852 is stated to have been 30,037,139 gallons; and the consumption has ever since been on the increase in England, and that at a rate faster than the growth of the population. But in Scotland and Ireland the consumption received a severe check in 1854 and 1855 through a large increase of the duty on home and colonial spirits (the duty there having been much below the rate for England), and the Scotch drinker had at the same time to encounter the Forbes Mackenzie Act, which has made it more inconvenient to obtain spirits. The result has been that the consumption in the United Kingdom in the year 1859 was no more than 28,661,674 gallons, or scarcely a gallon a head—the quarter to which the enemy is considered to make its way. Compared with 1852 the consumption in England had increased nearly 3,000,000 gallons, that of Scotland had decreased nearly 2,000,000, and that of Ireland 2,500,000. Not, however, that these last two portions of the kingdom are now behind England, for while England, with its 20,000,000 of people, consumed 17,000,000 gallons of spirits last year, Scotland, with its 3,000,000 of population, took 5,600,000; and Ireland, with perhaps only its 6,000,000 of inhabitants, very nearly that precise number of gallons; so that in England we do not take quite a gallon of spirits a year apiece, but Scotland drinks the deficiency for us, so as to bring the consumption of the United Kingdom up to about that rate. Still, while in 1851, with a population of 2,888,742, the consumption of spirits in Scotland reached 7,090,894 gallons, and was still higher in the next year; in 1859, with an estimated population a little over 3,000,000, the consumption was only 5,638,882 gallons. Whether the balance upon spirit-drinking, as between England and Scoland, is at all redressed by a difference in respect of wine and malt liquors is another question; but the spirit account stands as we have stated. The malt charged with duty in the United Kingdom has only risen from 41,072,486 bushels in 1852 to 44,219,300 in 1859; but little malt is charged with duty in Scotland and Ireland. The quantity of foreign and colonial wine retained for consumption in the United Kingdom was 6,364,061 gallons in 1852, and had risen to 6,775,992 gallons in 1859; what the "new refreshment houses" will do time will show. The gross amount of the taxation laid on all these liquors, and on licenses to manufacture and sell them, amounts to the enormous sum of 21,000,000*l.*; but that is subject to a deduction for over entries and drawbacks on exportation, or use for excepted purposes. The return from which we have been quoting makes no mention of hops, on which a duty of above 400,000*l.* was charged last year.—*Times.*

THE INVINCIBLES OF COMMON LIFE.—What a glorious troop might be formed of those men who have won their laurels in the campaign of life; fighting, not against sword and bayonet, musket and cannon, lance and sabre; but against hardship and circumstances, natural defects, and the ridicule or opposition of their fellow-men! There has been, and still is, we trust, many a man, who—seeing before him a great and noble end to be gained; God's glory to be advanced; man's happiness and well-being to be extended; the Gospel to be preached; the truths of science to be ascertained; the ignorant to be enlightened; the depraved to be raised, or good of any kind to be done—has manfully determined to do it, and has not failed. How far greater the honour; how much more worthy the victories of such men than those of mere soldiers! And *their* deeds have not perished with them; their useful works remain as monuments to their glory. Possessing noble, enterprising spirits; a courage nothing can daunt; an endurance superior to all rebuffs and all hardships; a perseverance which rises again in spite of failures: these invincibles have conquered where all other men have been beaten back by the opposing obstacles; nay, where others have not even dared to make the attempt. Nor has the fight been against a visible or tangible foe alone: these men have had *themselves* to conquer; their ignorance or indolence; their natural leaning to evil; the bad habits of early days; or even their poverty and the lowness of their social station.—*The Art of Doing our Best.*

SAILORS' HOME AND DESTITUTE SAILORS' ASYLUM.—The monthly meeting of directors was held on Thursday, the 13th Dec., at the Sailors' Home, Well-street, Captain C. J. Bosanquet, R.N., in the chair. The secretary presented the accounts, by which it appeared that the number of boarders in the Home has lately been very large, as many as 350 seamen having been lodged in one night. The sums of money remitted home by seamen since the 1st of May amounted to £14,724. 6*s.* 9*d.*, and deposits in the Board of Trade Savings-bank to £2,399. 12*s.* 9*d.* A donation of £100 was forwarded to the directors by an anonymous friend through Messrs. Ommanney and Co. The secretary reported that several visits had been paid to the Home by a French gentleman connected with the *Messageries Impériales*, with the view to the establishment of a similar institution at Marseilles for the seamen of that company. Tenders for the supply of provisions for the quarter commencing the 1st of January, 1861, were submitted, showing nearly the same prices as for the current quarter. The seamen enrolled at the Sailors' Home for the Naval Reserve number 332. With reference to the Destitute Sailors' Asylum, it appeared that during the past month 70 distressed sailors have been relieved, not only with food and shelter, but also with a supply of warm clothing; and as winter advances the number may be expected to increase daily.

NEGLECTED MIDDLE-CLASS EDUCATION.—The following extract from a letter addressed to a Somersetshire magistrate by an experienced Inspector of Schools will afford but too true a picture of the condition of small farmers' sons in other counties and districts:—"The middle classes in this, as well as other districts, are more uncared for than the poor or the independent. Their parents as yet do not feel the vast importance of the matter, and the high prices of the present moment are to them a powerful argument that with their present mental acquirements they can gain money and save money. They never think, reason, or argue on the beneficial influences of a sound education—no, nor even of its pecuniary advantages. Among a hundred farmers' sons, I cannot find one scarcely who knows the nature of the soil he cultivates, what will improve it, or what are the best materials to mingle therewith. They do as their forefathers did, and what they do they do without a reason. This ought not to be, to say nothing of morals, nothing of that high feeling which would make them useful members of civilized society, capable of well filling the sacred trusts of home life, public life, political life. One year or two of boarding-school education, after a miserable drilling by a village schoolmaster, is all that now around here for miles is granted to the middle classes. If you could influence your brother magistrates to take up this matter, and to provide a school, say in the neighbourhood of Weston-super-Mare, there to give a solid useful education,—teaching agriculture not only by chemistry, but by taking some 20 or 30 acres of ground, it would be an inestimable benefit. The arrangements should be so conducted as to average in cost from 30*l.* to 40*l.* Such a school would not only be a blessing to society, but would, in a short time, be self-supporting, and serve, moreover, as a stimulus for the formation of similar institutions in the county. No time is to be lost if we mean to keep the farmers in their proper place, and prevent their being overtaken and distanced by other classes."

THE THRIFTY SCOTCH.—The Scotch have now 51 public savings-banks. One county has seven; three, four each; three, three each; seven, two each; nine, one each; and eight none. The number of accounts open at the date of a recent return was 132,812, and the total amount standing to the credit of depositors 2,211,001*l.* The number of annuities granted was 1,109, and 46 deferred, the total amount being 18,112*l.* The average sum received from each depositor in the last year to which the return extends was 3*l.* 7s. 9d., and the average payment (including interest), 4*l.* 10s. 9d.,—rather an unfavourable aspect of affairs.

A GOOD FAMILY MEDICINE CHEST with a prudent use has saved many a life; and yet we think the idea might be improved upon, and reduced to a more simple form. Take some good compound, such as COCKLE'S ANTIBILIOUS PILLS, and we find that the desired end may be obtained without scales and weights, or little mysterious compartments and enchanted bottles with crystal stoppers. Others might be used, but Cockle's Pills, as tested by many thousands of persons, and found to answer their purpose so well, may be set down as the best.—Observer.

HOLLOWAY'S PILLS.—FOGS, FEVER, INFLUENZA.—In all large and populous cities the air is more or less vitiated, and malaria always causing disease. To counteract the maladies arising from these pestiferous vapours, nothing is so safe and certain as Holloway's Pills. They act on the human blood as a filter acts on dirty water, and, like it, remove mechanically or chemically all gaseous or fluid impurities, and all noxious matters. These admirable Pills possess every attribute requisite for a purifying, preservative, and restorative remedy. They successfully grapple with indigestion and fever, and what is still more astonishing, while they thoroughly cleanse the entire system, they regulate and strengthen every individual organ. Holloway's Pills suit either sex, all ages, and every climate.

ST. GILES'S NATIONAL SCHOOLS.

In Broad-street, St. Giles-in-the-fields, upon a spot occupied only the other day by a number of mean, old, and dilapidated tenements, there has just arisen a fine, spacious, and substantial building, which has been constructed for the use of the national schools of this parish, and the inauguration of which took place on Wednesday, Dec. 19. This building contains three large school-rooms, one above the other, viz., the infants' school-room, measuring 70 feet by 24, and the girls' and boys' school-rooms, 70 by 30 each. There are, besides, three class-rooms, each measuring 30 feet by 20, and the basement can be fitted up for an industrial school or any other appropriate purpose hereafter to be determined on. In addition to all this the structure comprises three complete residences for the master and mistresses. It is estimated that accommodation is provided for 1,000, or even 1,500 scholars. The building is composed entirely of variously-coloured bricks, a few encaustic tiles being used to heighten the general effect. The architect, Mr. Edward M. Barry, has selected for the style that known as the Venetian Gothic, and, after making the best possible use of the space allotted to him by forming light, airy, and spacious school-rooms, has enclosed the whole within a handsome exterior.

The inauguration meeting was held in the boys' school-room, which was ornamented with banners inscribed with passages from the Scriptures, and soon after twelve o'clock, at which time it was arranged that the proceedings should commence, a large number of ladies and gentlemen had assembled.

The chair was taken by Mr. A Kinnaird, who was supported by Sir J. K. Shuttleworth, the Venerable Archdeacon Sinclair, the Rev. A. W. Thorold, rector of St. Giles's; the Rev. E. Bayley, rector of St. George's, Bloomsbury, and several gentlemen of local reputation.

It had been announced that Lord John Russell would preside upon the occasion, and considerable disappointment and regret were experienced when the noble lord's compelled absence and the cause of it were communicated to the assembly by the Rev. A. W. Thorold, who stated that he had received a letter informing him that Lord J. Russell had been summoned to attend the Duke of Bedford, now seriously ill at Woburn Abbey, Bedfordshire.

After some hymns and psalms, the schools were formally opened by the chairman declaring:—"In the faith of Jesus Christ, and to the glory of the Eternal Trinity, I open these schools to the children of the labouring classes in the parish of St. Giles-in-the-Fields."

Prayers followed, after which,

The Rev. A. W. Thorold made a statement, in the course of which he adverted to the great scarcity of building ground in the neighbourhood, and to the fact that his immediate predecessor in the incumbency, though well aware of the desirableness of erecting new schools, was unable, during the five years he was rector, to procure suitable ground for the purpose, or he need hardly say to the friends and parishioners of the Bishop of Ripon that the work they were now met to complete and inaugurate would long ago have been nobly set on foot. He then described the internal arrangements of the edifice, the particulars of which we have already given, observing that two playgrounds were attached to the establishment. The cost amounted in all to 12,500*l.*, of which one-third was for the site. The Committee of Council on Education had made a grant of 3,000*l.*, and 9,000*l.* had been contributed by the landowners, residents, and the public at large. When it was remembered that barely two years and two months had elapsed since the scheme was first brought before the parish, they would all feel that other than human hands had raised the walls. The sum of 500*l.* was still required for the building fund, and he was not without hopes that before the day closed that amount would be materially diminished. Of the genius displayed in the design of the construction (the builders of which we may here mention are Messrs. Mansfield and Son) they all might judge, but he had had peculiar opportunities of observing the incessant attention and the unwearied diligence of the architect, Mr. Edward Barry. After adverting to the sad intelligence which it had fallen to his lot to communicate at the commencement of the proceedings, and to the munificence exhibited in aid of the undertaking by the head of that great English house with which the neighbourhood was so associated, the rev. gentleman concluded by expressing an earnest hope that the many valued friends who had contributed to raise the walls of that building would still continue to be interested in it when the present passing excitement was over, and would often pray that the Church in that parish might be more and more a nursing mother to the young, and that all might hear and learn that sentence of the Son of God—"It is not the will of your Father which is in Heaven that one of these little ones should perish."

The meeting was then successively addressed by the Chairman and Sir J. Kay Shuttleworth, both of whom expressed deep regret for the cause which had prevented Lord J. Russell's presence at the meeting. They congratulated the rector of the parish on the great result which had been so speedily achieved, and observed that it afforded an example of the advantage of the system through which grants of money for education were given by the Privy Council in aid of voluntary subscriptions. Sir J. Shuttleworth, who stated it as his positive conviction that in such a district as St. Giles's such an enterprise as that now achieved would have been impossible without the aid of the Government, concluded by moving the following resolution:—

"That this meeting gladly recognizes in the erection of these buildings the great progress of public sympathy with the education of the poor, and heartily trusts that the zeal and liberality so remarkably evinced by the proprietors and residents in this neighbourhood will be cheerfully continued for the permanent maintenance of the schools in efficient working order."

The Ven. Archdeacon Sinclair seconded the resolution, and stated that from all he observed, not only on this but on the other side of the Atlantic, he was convinced that, if the present educational system in this country were superseded, it would be hardly possible to establish another equally efficient. He cordially congratulated the rector of the parish on the completion of the schools, and he trusted that the parishioners would not disappoint his energy, but make up the existing deficiency in the building fund, and support the schools by annual subscriptions.

The resolution was carried unanimously.

The Rev. E. Bayley, rector of St. George's, Bloomsbury, moved a vote of thanks to the chairman. With reference to the Duke of Bedford, whose illness had been announced to the meeting, he said he knew the great interest taken by that nobleman in everything connected with national education and the building of schools, and he was sure that his Grace would be cheered by the successful result of the efforts made to erect the present building, a result which the noble Duke had largely and liberally aided in accomplishing. He remembered the Duke of Bedford saying that when he came into his property there was only one parish on it where there was what he considered to be an efficient national school, but that at the time of his then speaking there was not one parish in which he had property without an efficient national school.

The motion being seconded by Mr. Hawthorn, was carried unanimously.

After the Doxology and Benediction, the company dispersed, the children belonging to the schools singing a hymn.

In the evening a tea meeting took place in aid of the building fund, and it was announced that a conversazione would be held on the 3rd, as well as on the 4th of January, with the same object.

CITY COMMISSION OF SEWERS.

On Tuesday, December 5, the City Commissioners of Sewers held a Court for the despatch of business, Deputy Christie acting as Chairman. Touching the sanitary condition of the city, Dr. Letheby, the medical officer of health, reported that 214 houses had been inspected during the week, and he submitted a list of fifty-six places for sanitary improvement, together with a list of places that required further proceedings on account of orders issued

Digitized by Google

but not yet complied with. He likewise reported that the markets and slaughter-houses had been duly inspected in the course of the week, and that the officers had seized 3,992lbs., or rather more than a ton and three-quarters of meat as unfit for human food. Of this 1,392lbs. were seized in Newgate-market by Mr. Fisher, 626lbs. in Leadenhall by Mr. Davidson, and 1,974lbs. in Aldgate and Newgate by Mr. Newman; 3,268lbs. were seized because of disease, 164lbs. on account of putridity, and 560lb. by reason of the animals having died from natural causes. All of it had been sent to the boilers' and destroyed as food. The mortality returns for the week were a little above those of the preceding week—indeed, they had gradually risen during the last four weeks from 43 to 60; but still they were greatly below the average for the season. For the corresponding week of the last five years the proportion had been 69·29, or nearly half of the deaths were among children of less than five years of age, and eight were among old persons. The chief causes of death were as follows:—phthisis, 9; pneumonia, 9, 8 of which were among infants; and bronchitis, 8—in all 26 deaths from diseases of the respiratory organs. The average weekly number during November was but 16, so that the damp and cold weather was beginning to manifest its influences in causing or aggravating this class of maladies. Among the zymotic group of diseases there were returns of 13 deaths—namely, measles 4, croup 1, and two from each of the following:—continued fever, scarlet fever, whooping-cough, and erysipelas. In the mortality returns for last week, furnished by the Registrar-General, there was a return of the death of an infant from convulsions, caused by the foul atmosphere of the room. The death occurred at No. 6, Reynold's-court, Moor-lane, and he (Dr. Letheby) considered the return to be of such importance as to demand a special inquiry. He therefore requested the inspector to make a careful examination of the premises, and he had reported that the house was in good order, the drains well trapped and in perfect condition, and the water supply ample. He also reported that the room was in a cleanly state and well ventilated. He (Dr. Letheby) had himself visited the house, and found that the report of the inspector was correct, and he was of opinion that the death did not arise fram the cause named. The child was a patient at the Aldersgate Dispensary, and was seen but once at the house by the medical attendant. Dr. Abraham, adverting to the diseased meat reported by the medical officer to have been seized during the week, asked whether the quantity was not unusually large. Dr. Letheby replied it was not much more than the average of weekly seizures. Dr. Abraham urged that some proceeding ought to be instituted by the Court against persons exposing such meat for sale. Dr. Letheby said that question, together with the mode of disposing of the diseased meat, had been the subject of a special report by him, and was now under the consideration of the General Purposes Committee. Dr. Abraham inquired as to the time of day in which the seizures were made. Dr. Letheby said the largest quantity of diseased meat exposed in Newgate-market was generally on Saturday nights, between 6 o'clock and midnight, and it was sold to the poor at the rate of about 14lb for 1s. Mr. Newman, the inspector of meat for the Commission, said, in answer to questions by the Court, that the principal exposure of diseased meat was between 4 and 8 o'clock in the morning, and from 6 to 12 at night. The practice was carried on to a great extent in Newgate-market, so much so, indeed, that he was perfectly ashamed of it. He had seen tons of it in the market: the reason he did not remove it was that he had no place to put it in, and, not being removed, it was gone the next day—he did not know where. The Chairman said the whole question was now under the consideration of the General Purposes Committee, and he expected they would report upon it at the next Court. Dr. Abraham said the present mode of inspection was evidently imperfect and unsatisfactory. The Court was answerable for all the evils that took place under it, and it was high time to amend it. Deputy Bernard said those evils would continue until Newgate-market was abolished, and a new one established in Smithfield. Mr. Lowman Taylor said, at the next Court of Common Council the important subject of the proposed new market, and the consequent abolition of that of Newgate, would be brought under consideration. Dr. Letheby reminded the Court that at present only one of the inspectors of meat acted under its instructions, and that it had no control over the clerks of the market, who also seized meat. The subject then dropped. A conversation, begun by Mr. De Jersey, ensued in reference to the resumption by the Court of the adjourned consideration of Mr. Train's system of street railways. The expediency of adopting it for the city was slightly canvassed, but upon no regular motion. Several members pointed out difficulties in the way of its practical application to a city so peculiarly circumstanced as London. Eventually the subject was adjourned indefinitely, and the Court separated.

ADULTERATION OF FOOD.

A Report has recently been addressed by Dr. Letheby to the Committee on General Purposes of the City Commissioners of Sewers, on a subject of considerable interest and importance—namely, the practical means of applying within the City of London the Act passed last session for preventing the adulteration of articles of food or drink. On the Commissioners of Sewers, by the statute in question, the duty devolved of appointing a public analyst of food, within their extensive jurisdiction, which embraces the whole of the city of London, and they recently conferred that appointment upon Dr. Letheby, who is busily engaged in making all the necessary arrangements for carrying out the intentions of the Legislature in the interest of the health of the civic community at large, but more especially of that of the poorer classes. He states in his official report, of which we give the material portions, that two classes of adulteration are aimed at by the Act—first, those occasioned by the mixture of any ingredient or material injurious to the health of persons eating or drinking it; and secondly, those accomplished by the mere admixture of a substance not injurious to health, but in fraud. As examples of the first class, he mentions the use of poisonous pigments for colouring confectionery; of red lead in Cayenne pepper and curry powder; of chromate of lead in custard powders; and of the salts of copper in pickles and preserves. Of the second class, he refers to the addition of inferior nutritive matters to bread, as potatoes and rice; the mixing of cheap farinas, as potato starch, the starch of curcuma, wheat, rice, bread-fruit, &c., to arrow-root; chicory and roasted corn to coffee; inferior roots, &c., to chicory; mustard husk and farina to pepper; flour to mustard; water to milk; oxide of iron to cocoa and chocolate, and the various facings or glazings of inferior tea. A third class of adulterations, he says, occupy an intermediate place; for, while they are undoubtedly frauds, they are, perhaps, also injurious to health—as the addition of alum or sulphate of copper to bread; sulphuric acid to vinegar; plaster of Paris and chalk to confectionery and mustard; the various sophistications of ale and porter; and the still more objectionable adulterations of wines and spirits. All these may be properly made the subject of analytical inquiry, for they clearly come within the compass of the Act. It is necessary, he says, that according to its provisions the different stages of the investigation shall be conducted in a systematic manner. First, in respect of the purchasing of the article, in all cases the purchaser of an article suspected to be adulterated shall, directly he has purchased it, and before he removes it from the shop, give notice to the dealer, or the person serving him, that he intends to have the article analysed, so that the dealer may have the opportunity of accompanying him to the anylist, or of securing the article in such a manner as to prevent it from being tampered with. Secondly, as regards the analysis, wherever an analyist is appointed any purchaser of an article of food or drink shall be entitled, on payment to the analyst of a sum not less than 2s. 6d. nor more than 10s. 6d., to have the article analysed, and to receive from him a certificate of the result. Considering, however, that it is not easy or practicable to draw up a scale of charges for the various kinds of investigations contemplated by the Act, and that the fee named will rarely cover the expenses of the analysis, it will, Dr. Letheby thinks, be expedient to fix an uniform charge, intermediate in the scale—say 5s.—for each analysis. This will prevent a great deal of complexity, and will at the same time show that the object of the charge is not to cover the expenses of the inquiry, but rather to guard the dealer against unnecessary annoyance and groundless complaint. The poor, however, who are the chief sufferers from adulteration, will, he fears, be unable to pay the fee named; and, unless something be done to assist them in the matter, they will be shut out most completely from the benefits of the Act. He suggests, therefore, that the Commissioners of Sewers give to the analyst a discretionary power to conduct such inquiries for the poor without fee. It

Digitized by Google

is necessary, however, that a complaint should first come to him from a poor person, and the complainant should be entitled to leave with the analyst a sample of the suspected article, together with the name and address of the dealer; and if in the judgment of the analyst the matter is sufficiently serious to demand inquiry, he shall be at liberty to instruct the inspector to purchase a sample of the suspected article at the place named, and then to submit it to analysis free of charge. It is also a question for consideration whether they may not with great public advantage authorize their inspector of meat and of markets to purchase samples of food or drink which he sees exposed for sale in the city, and which he suspects are adulterated. This duty comes very properly within the functions of his office; for in the 52nd clause of their Act of 1851, it is provided that the inspector of meat and of markets shall have power to seize and dispose of any "unsound or unwholesome meat, fish, poultry, fruit, vegetables, or other provisions unfit for the food of man," provided he sees such articles exposed or offered for sale within the city. He may, therefore, exercise this duty in the proper functions of his office, and with great benefit to the public. Lastly, in respect of the certificate, it is constructed so as to indicate the object of the inquiry, and to express the result of the analysis. It also expresses the opinion of the analyst—whether the article is adulterated or not, and whether the article is so adulterated as to be injurious to health. These, indeed, are the several points to which the Act has directed attention; and in giving expression to them it is necessary, on the one hand, to be very explicit, so as to expose fraud, and on the other, not so emphatic as to furnish a puff for the rivalries of trade. At the end of every quarter it will be his duty to submit to the Commissioners a tabular statement of the analytical work done, specifying the articles examined, and the names and addresses of the persons from whom they were purchased. The publication of that table in his quarterly report will doubtless have a beneficial tendency. If it be necessary to go further with the inquiry, it must be prosecuted by the purchasers of the adulterated articles, who will have to take the matter before the justices, where the certificate of the analyst will be received as evidence.

CHRISTMAS BENEFACTIONS TO POOR CLERGYMEN.

THE Governors of the Corporation of the Sons of the Clergy held a meeting on Saturday, Dec. 15th, at their house, No. 2, Bloomsbury-place, for the annual distribution of certain benefactions among poor clergymen, and especially curates. The sums granted on this occasion were to 26 clergymen 20*l.* each, to 20 others 15*l.* each, and to 39 10*l.* each, in all about 1,200*l.* among 85 recipients, many of whom, however, receive a further grant in June, when other and more considerable benefactions are annually distributed among clergymen holding benefices or curacies, or without duty, and possessing very small means but large families. These, again, are also materially assisted from time to time in the education of their children and in providing outfits for them on entering into various situations in life. Several applications were deferred for further inquiry until January, when the governors will again meet for the consideration of those and other applications from the necessitous clergy and their families. The Christmas benefactions, however, form only a small portion of the entire sum annually given away by the corporation—viz., about 16,500*l.* in donations to clergymen, pensions to their widows and aged single daughters, and grants towards educating and placing out in life the children of poor clergymen. The funds are administered without reference to locality, personal influence, or party views in the Church. The only points to which the governors directed their attention, and of which they require to be satisfied, are the personal worth and necessity of the applicants, and when these are established assistance is given temporarily or permanently, according to the age, income, number of children, and other circumstances of each case. The corporation received its charter from Charles II., and during the long interval which has since elapsed has become possessed of considerable funds intrusted to its charge by benevolent persons in successive generations, who have witnessed the privations of the poorer clergy; but it is obvious that in the present times, when the number of curacies and scantily endowed benefices is rapidly increasing, the number of applications for assistance from the corporation must also greatly increase, and unless the funds of the society are proportionately augmented, they must soon become very inadequate to meet the pressing demands made upon them by one of the most meritorious and ill-paid classes of the community.

THE SOCIAL EVIL AT LIVERPOOL.—A midnight meeting of the fallen women of Liverpool has been held. It commenced about eleven o'clock, was attended by nearly 200 women, and did not conclude till after two o'clock on Saturday morning. It was calculated that probably a fifth out of 500 invited by card might attend, and there would be ample room for the first meeting. The committee were far out of their calculations. They had not thought of crinoline. The room was crowded soon after eleven o'clock, and a great number were unable to obtain admission. The tables were well laden with bread and butter, bunloaf, and buns, and all the etceteræ that make tea so comfortable and social a meal. The bold, harsh, defiant features were characteristic of the majority; a few of the slimly formed had the pensive air of drawing-room young ladies. On some the stamp of vice had hardly set its mark, but almost every trace of womanly refinement seemed lost in many of the older portion of this company. After tea several speeches were made to the women. After a hymn or two and the offering of prayer, the proceedings of this extraordinary meeting terminated about two o'clock on Saturday morning. Nearly eighty remained to go to the home in St. Anne-street.—*Liverpool Mercury.*

INDIAN CORN AS FOOD.

I WISH to offer a few observations on the supply of a cheap and wholesome article of food for the poorer classes, which is slowly growing into favour in this country, and might, as I conceive, enter much more largely than it does at present into the dietary lists of workhouses, prisons, and charitable institutions, with advantage both to the donors and the recipients of relief, the rate-payers and the inmates of such asylums. And I think I need make no apology for endeavouring to engage the attention of this section in a subject of such primary importance to the sanitary condition of the masses, as is that of the supply of wholesome and nutritious food.

The article to which I desire to draw your attention is maize, or Indian corn. This magnificent and valuable species of grain appears to be indigenous in America, and to have been introduced into Europe by Columbus. It must have spread over the Old World with great rapidity, since we find it soon after this period cultivated in Turkey, and then in the surrounding countries under the name of Gran Turco (Turkey Grain).

It is found to grow vigorously, and yield largely wherever the conditions of a high

Digitized by Google

summer temperature, abundant rains, and a moderately fertile soil co-exist, and these conditions are met with throughout regions of vast extent, scattered over a belt of 84 degrees of latitude, between 42 north and 42 south of the line.

The Danubian provinces, Egypt, but above all, North America, are the principal sources of our supplies of this grain, and the importations are now reckoned by millions of quarters in the year. Under existing arrangements, it is frequently sold in this country at a price which is found to render it economical for horse feed, *i.e.*, cheaper than beans or oats; but low as is the average price at present, I believe it might be imported at a yet lower price, by simplifying the means through which it reaches the consumer, and I will give my grounds for this opinion.

When the traveller in the far West surveys the vast plains of Illinois, Indiana, Iowa, Ohio, and Missouri, covered with a waving crop of this truly golden grain, which may be almost said to grow wild, so small is the amount of culture requisite, I think he cannot fail to be impressed with the idea, that were its value for human food but duly appreciated in England, and arrangements made for a regular supply by direct importation from the great West, the bulk of it, which now goes to the distillery, or to fatten hogs for market, might be made to serve the nobler purpose of renewing the strength and vigour of the half-fed poor of our island. Indeed, no sentiment is more commonly met with in the diaries of travellers in these regions, than that of regret at the comparative waste of so bounteous a provision of nature, accompanied with a wish that the starving masses of Europe could be transported to districts thus teeming with plenty; and a very natural sentiment it is; but surely the more sensible wish would be that an article raised with so little labour as scarcely to furnish occupation for any large population in its culture* should be transported to those countries and districts where circumstances are more favourable to the active employment of large masses of people. Indeed, it may be a question whether, on the score of health and well-being, it would conduce to their interests to transport them suddenly (supposing that were possible) to these regions of profusion, because the salubrity of the corn-growing States must be taken into account; and it is unfortunately the fact, that many an extensive tract of the richest soil in these Western States is so rife with fever and ague as to afford a very unwholesome residence for strangers. But if we direct our attention to the other, and only practicable alternative—that of bringing the corn to regions where the population exists—we shall see that the constantly increasing facilities of transport furnish just the means requisite for the attainment of this great end.

I will enumerate some of these facilities. "Corn," as maize is emphatically called in America, is grown extensively for home consumption in all parts of the United States; but Illinois, and the adjoining States of Indiana and Iowa, furnish the great bulk of that which is exported to England; and these, it is to be remarked, are free States. In using American corn, therefore, we need not be apprehensive of laying ourselves under any obligation to slavery.

Chicago is the *entrepôt* of these States; a perfect network of railways and canals converge to this great emporium, which is situated on Lake Michigan, 1,000 miles from the seabord; but this 1,000 miles is spanned by three great rival lines of railroad; by the navigation of the great lakes and river St. Lawrence, and the Erie Canal and Hudson, all of which vie with each other in celerity and cheapness of conveyance. These railroads are the New York and Erie, and the New York Central to New York, and the Grand Trunk line of Canada to Quebec and Portland. The Erie Canal is the immediate competitor of the two American lines, as the St. Lawrence with its canals is of the Canadian one.

It may be supposed that with so many rival means of conveyance to the coast, the cost of transport is reduced to the very lowest sum that is remunerative, and such is the case. Being dealt with wholly in bulk, transferred from barges or railway cars to vessels, and *vice versâ*, by means of grain elevators worked by steam power, the human labour engaged in the transport of corn is very small, and the various lines which I have mentioned are able to forward it to the coast for about 20 cents. 10d., a bushel. The freight across the Atlantic is about as much more; hence the price at our own seaports need not exceed by more than 1s. 8d. to 1s. 10d. that at Chicago, and the price at Chicago has for the last ten years averaged 1s. 8d. per bushel; therefore, in ordinary years anything beyond 3s. 4d. or 3s. 6d. per bushel in England, may be set down as merchants' profit; and I fully believe that if arrangements were made through a proper agency at Chicago, an unlimited supply of this staff of life might be brought to the consumers in Great Britain even below this price. Mr. Caird considers that it may be landed in England at 25s. a quarter (or 3s. 1½d. a bushel), after paying all expenses, and will then leave 1s. 8d. a bushel to the grower. (See the "Prairie Farmer," by James Caird, M.P., page 84.) This is a much lower price than the very poorest quality of rice commands, and how much superior it is in intrinsic value to rice may be judged from the analysis, which shows that maize is even richer in gluten and oil than wheat, whilst rice consists almost wholly of starch. It is to be observed that when this grain is as cheap, weight for weight, as oats (and it is usually cheaper), the meal should be considerably lower than oatmeal, because the waste in grinding is much less. But it may be asked, if the superfluity is so great, how happens it that large stocks are not consigned to England on speculation, in which case it would occasionally be thrown on the English market at a very low price? I apprehend the reason of this to be, that it readily and rapidly ferments when kept in bulk, unless constant pains be taken to move it—hence it is a dangerous article for speculators to meddle with. Moreover, it is a comparatively new thing in the English market, and the demand, consequently, less steady than that for wheat. This tendency to spoil is the only disadvantage, as far as I am aware, attending its importation, and it may be obviated by care that it is sound and dry when put on board; that the hold is dry and sweet, and that no leakage of the vessel be allowed to reach it. If an agency were established at Chicago (as I suggest) for the supply of some of our large unions, prisons, &c., it would probably load vessels there for the direct route by the great Lakes, Welland Canal and St. Lawrence to England. Vessels of 400 tons, carrying 16,000 bushels, can proceed by this route; 1s. a bushel would pay such a vessel 800*l*. freight, or the agency might forward the grain by propellers to Montreal, and thence ship it to England.

I can conceive of no cause for the too general neglect of this aliment in our charitable institutions, except it be owing to ignorance of its merits, or the unreasoning prejudice which opposes so serious an obstacle to the introduction of anything novel, however great and manifest its utility. It is, however, an encouraging fact that oatmeal has been successfully introduced through the medium of the "Union" into the dietary of the South of England, where not many years ago it was regarded by the poor as horse's food, and no more fit for human consumption than so much hay. Why should not Indian corn meal,

* Three hands, two men and a boy, will till 100 acres of corn (this will yield from fifty to sixty bushels per acre), equal to 5,000 to 6,000 bushels, which, at eight bushels per head per annum, would feed 700 people.—See Caird's "*Prairie Farmer*."

Digitized by Google

which could be procured at so much cheaper a rate than oatmeal, be partially substituted for it? I say partially only, because it is found to be somewhat heating when taken alone by those who are unaccustomed to it; but if Indian meal, gruel, and hominy, were to alternate with oatmeal porridge for the union breakfast, and maize were mixed with wheaten flour, in the proportion of one-third, for bread, I think the rate-payer would find his account in its greater economy and the poor man in the variety thus introduced into his diet, no less than in the advantage of accustoming his palate to its taste. At present, as far as I can ascertain, it is but little known or used ostensibly in the South of England. I say "ostensibly," for it is shrewdly suspected to be extensively used for purposes of adulteration; indeed, the low price at which wheaten bread is frequently contracted for points inevitably to some such sophistication. The present time appears to be singularly favourable for the open and systematic introduction of it, for whilst our own crops are, I fear, likely to prove somewhat deficient, and flour and oatmeal proportionably dear, the maize crop in America is represented as unusually abundant, far exceeding that of any former year. It is estimated at the enormous total of *nine hundred millions* of bushels, which, at the usual English estimate of eight bushels per head per annum, would feed upwards of one hundred and twelve millions of people, *i.e.*, four times our population. It is remarkable that this crop steadily increases in America in a much higher ratio than does the population. The increase from 1840 to 1850 was 66 per cent., whilst population increased only 35 per cent. in the decade, and we see nearly the same increase maintained in the present decennial period, viz., from six hundred millions, to nine hundred millions of bushels. The wonder is, what will become of this vast supply. Indeed, so great is the surplus of this grain, and its value, consequently, so little affected by the demand for export, that it appears as if it were a reserve specially intended by Providence to supplement our deficiencies, and as such, it offers this great advantage, that it is a thoroughly reliable crop. Whilst the yield of wheat in the States owing to various circumstances, is exceedingly precarious, and the surplus of it annually declining, corn, on the other hand, never fails—has increased year after year with marvellous steadiness, and is still increasing. The potato famine in Ireland introduced it into that country, and so far accustomed the taste of the people to it that it now forms an important article of consumption amongst them. I cannot help hoping that some measure of good may arise out of the present dearth in England, if it help to reconcile the English mind and familiarise the English taste to a species of provision so admirably suited to our wants. One preparation of it is already finding its way to the most luxurious tables as well as to the sick chamber, under the name of Oswego flour, the port of Oswego, on Lake Ontario, being the place at which it is thus prepared, and a similar article is manufactured on a large scale at Paisley; but these, as must always be the case with any new thing whilst struggling into notice, are at present retailed at an extravagantly high price when compared with the prime cost of the material. I find it is but little known that this delicate article of food, which is rapidly superseding arrowroot, is nothing more than the white maize subjected to a simple process.

I have said that the great bulk of this grain is at present perverted to the uses of the distiller and fattener of swine, trades which go hand in hand, for large herds of pigs are fattened on the wash of the distilleries. The State of Ohio alone distils twenty-six million gallons of whisky per annum. Here is a fact for the temperance advocates. Vast herds of swine are also fed on the maize as it grows, the farm horses live on it, all kinds of stock and poultry are fattened on it—in fact, it is the universal pabulum for man and beast. So great is the profusion and consequent waste of this grain, that in parts of the Prairies distant from market, and where wood is scarce, the whole plant with the grain dried is sometimes burnt for fuel. I have never seen this done, but I have it on indisputable testimony. I have here a statement of the actual cost of growing it in the State of Ohio, taken from a respectable agricultural periodical, *The Country Gentleman*. It professes to be given by a farmer, and farmers are not apt to underrate the cost of production of their crops. He asserts that it stands him in, before gathering, less than six cents (3*d.*) a bushel; nine cents per bushel would probably be a liberal estimate of the cost of the same when shelled. Now on this estimate fifty bushels an acre (a moderate average), at 1*s.* a bushel, would clear him 33*s.* an acre, and that is many times over the fee-simple of his land.

COST OF RAISING INDIAN CORN.

Eds. *Cult. and Co. Gent.*—Do farmers usually know the comparative cost and profit of particular crops? I am trying to find out, and should be pleased to learn through your paper how the experience of others compares with my own. I subjoin my account with a cornfield of eighteen acres worked this summer, to be used as you think best. The ground and the corn have been measured—there is no guess-work about it.

Team and hand, 12¾ days' breaking, $2	$25.50
Cost of seed, laying off and planting	13.05
39¾ days' work, harrowing, ploughing, hoeing, &c., 87½ cents .	26.90
Use of team, equal to 26¾ days' single, 52 cents	13.91
Repairing tools	1.00
Entire cost, board, labour and all	$80.36

The yield is 1,350 bushels—costing before gathering not quite 6 cents per bushel.—W. A. G.
Ripley, Ohio. [*Country Gent.*

But let me not be understood to mean that corn is not appreciated in America for human food—far from this. Corn meal constitutes, par excellence, the habitual diet of the country population to a much greater degree than wheaten flour. It is the "daily bread" of the Northern and Western farmer; the whole negro population of the Southern States, than whom a more healthy and well-developed race nowhere exists, may be said to live on corn and corn fed pork, whilst at the table of the planters you seldom see any other bread than corn cakes. He and his family luxuriate on corn cakes, "Johnny cake," "Indian pudding," and "mush," which is corn porridge, whilst his servants live on hominy, "hoe cake," and "corn dodger," and the vegetable most esteemed by all classes is the sweet corn cut green or "in the milk," and boiled and eaten off the cob—a delicious esculent, which might, I have no doubt, be advantageously grown in the South of England. Surely, if it were sufficiently known amongst our poor how much this meal is preferred to wheaten bread by the Americans, and how surely any of themselves, who should succeed in realizing their cherished wish of emigrating to that land of plenty, would come to live on it and think wheaten bread insipid by comparison, they would so far overcome their prejudices as to give it a fair trial, and I will answer for it they would find themselves heartier and more able for their work after a full meal of this than after the half meal of the very whitest bread which the same sum of money would purchase. I subjoin an analysis of Indian corn compared with wheat, by the late Professor Johnstone:—

	Fine Wheaten Flour.	Indian Corn Flour.
Water . .	16	14
Gluten . .	10	12
Fatty matters .	2	8
Starch, &c. .	72	66
	100	100

Wheat contains 16 per cent. of water.

Peas ..	16	ditto.
Corn ..	14	ditto.
Beans ..	16	ditto.
Oatmeal ..	26	ditto.

Digitized by Google

From which it appears that it contains more gluten and oil, and less starch, than wheat; and by another analysis, collated from several sources, it appears that it contains about as much water as wheat, peas, and beans, but considerably less than oatmeal. The heat-giving property of this large percentage of oil is such as, on the authority of a distinguished arctic voyager,* to render Indian corn peculiarly valuable for the support of life in those frozen regions.

When one considers the high intrinsic value of this grain, its perfect adaptation to the wants of man, and the extreme abundance in which it is produced, one cannot be surprised that the idea of introducing it to the famished millions of the Old World should have excited the enthusiasm of more than one philanthropic mind—of Cobbett, who so long and so earnestly strove to induce his countrymen to substitute it for our own cereals, but who made the fatal mistake of recommending its culture in England, a climate wholly unsuited to it; of Elihu Burritt, who spared no effort, whilst making the tour of Europe, to bringing it into notice, and whose little "Olive Leaf from the Housewives of America to those of Great Britain" contains a complete collection of receipts for its cookery; of Henry Coleman and Dr. J. S. Bartlett and others, whose efforts would doubtless have been crowned with more success if they had enjoyed the advantage of pleading its cause before an influential association assembled for the express purpose of discussing topics of this nature, and of diffusing the information it collects, together with the results of its deliberations amongst the public.

In contracts for the supply of Indian corn, or the meal, the yellow corn should be specified, as that is richer in oil, and usually somewhat richer in gluten than the white variety, which, on the other hand, is the more valuable for conversion into starch, or for the diet of the invalid.

SKETCH OF A PLAN FOR INCREASED MORAL SUCCESS IN CONNECTION WITH NATIONAL SCHOOLS.

It appears very desirable that some well sustained and influential effort should be made to render our National Schools more efficacious in training the children in them to become useful, honest, and valuable members of society. It is now thirty-four years since I was permitted and enabled to open the first Girls' Reformatory School for Juvenile Delinquents. Five hundred and forty such *cases have* been received into the Institution. They are trained and fitted for respectable service. It is with great regret I add, many of these have been at an early age educated in the National Schools, and *in* our Sunday Schools, which leads to the *suggestion*, something beyond mental instruction is required.

In the National Schools there is no ulterior object presented towards fitting the scholars for earning a livelihood when they leave: this induces irregular attendance, and their being taken away at an age which peculiarly exposes them to temptation. Many of these become candidates, by pilfering habits, for Reformatory Schools, in which are provided board, clothing, lodging, and instruction, not only mental, but such as fits them for service. The moral poor make an effort to send their children to the National Schools, but feel when they leave they are as unable to earn a livelihood as when they entered those schools; and many are feeling much discouraged by the Reformatory Schools providing a means for fitting for service, while they can obtain no such boon. I will preface, however, what I am about to suggest by saying, the Reformatory effort is surely demanded of us, as followers of *Him* who came to seek and to save those which were lost. Yet, may it not be added, "This ought ye to have done and not left the other undone"? Too long has the awful progress of juvenile delinquency been neglected, but now the nation is awake to the duty of endeavouring to reform almost infant criminals. Let us beware of even appearing to hold out a reward to careless and wicked parents to train up their children in evil ways as a means of their being well provided for; while the poor, sober, and correct parents see their children on leaving the National Schools as far removed from being able to obtain a respectable livelihood by working with their own hands as when they entered those schools—inasmuch as washing, baking, cooking, and housemaid's work, has never been taught them. This, I fear, is one cause of the girls of the National Schools being removed at so early an age; for should they remain even years longer (under the present system) no fitness for service—or in the case of boys—no knowledge of trade could therein, or thereby, be obtained. What is learned of head knowledge is speedily forgotten, and the want of suitable and remunerative employment leads them to bad associations, and many such seek for the advantages held out in reformatories, which are also "Industrial Schools."

It appears very desirable that the children educated in the National Schools should be induced to remain longer in them, that they may continue in a measure less exposed to bad example. Also, that they should be shielded from much temptation by being fitted to fill their proper place as industrial and honest members of society. The parents would, in most cases, leave their girls longer at school if, at the age they usually leave, some proper inducement could be offered for their continuance, such as a class being formed for elder and well-conducted girls for learning to cut out and entirely to make their clothing, for which they might from the school funds receive 1s. per week, which is the usual amount they get on leaving school, at twelve or thirteen years of age, for nursing a child about the streets. But far better, and what I earnestly desire to see in connection with the National Schools, would be "Industrial Schools," to which, from time to time, as good conduct at twelve or thirteen years of age should make them eligible, girls should be promoted and taught to be good and efficient domestic servants; and, on leaving for service, recommended by the committee, be able to obtain and retain creditable situations as cooks or laundry-maids, or house, or nurse-maids. This would form an ulterior object of gain to the parents who might thus be led to secure regular attendance and make every effort for good conduct while their children were day scholars in the National School. The Council of Education, which is so liberal in giving grants under "The Industrial Schools' Act," would no doubt assist in the above establishment and support of such schools, and it appears to me it would so commend itself to the judgment and approval of most of the subscribers to the National Schools, that every annual subscriber would add a little towards the support of "The Industrial School." As regards the boys, those whose moral conduct is satisfactory, should also be induced to remain longer in the schools, by teaching them shoemaking, carpentering, and tailoring, for a few hours a day in an adjoining room, so that they might, on leaving, be able to be apprenticed as good and honest workmen. Several from a reformatory near London have been apprenticed without premiums, because satisfactory every way. If trade should not be desirable for a boy, a small sum might be placed at the savings bank in his name, to be drawn out at a given age. Encouragement

* Sir J. Richardson.

so amply afforded to the subjects of juvenile delinquency seems to call for something similar on behalf of the moral poor and their families. Might it not be desirable for district visitors to form a part of school committees, as the conduct at home and in the streets is frequently very different from that in the class and within the school?

At present there does not appear to be any well-sustained effort for the above objects. There are two or three cooking-schools or kitchen-schools in different parts of London, in which, for a few hours in the day, once or twice a-week, girls are instructed; but the discipline, habits, and varieties of regular service cannot thus be arrived at, and the girls going and returning through the streets present difficulties to this being a help to moral training. Miss Burdett Coutts, in giving liberal aid and suitable prizes for industrial training and acquirements, is doing a good work in this direction. And I believe, at Whiteland, much is doing of this kind, as far as that one example can go. "The Girls' Laundry," rather recently established under the auspices of Lord Shaftesbury, is encouraging, as regards some points now under consideration. But payment to be received is necessarily required, and it is not in connection with National Schools or with parochial agency. In Marylebone there has been for many years a Parochial Industrial School for the children of respectable parents of *that parish;* but how far this would be a model in successful training for the Female Servants' Industrial Schools —I would earnestly desire to see appended to every London parish, and in connection with the National Schools—I am not fully aware. I believe the establishment of such would form one important link in the chain of religious and benevolent effort now strengthening and extending in the midst of us, and prove, with the blessing of God, a means of preserving from temptation those who, *as yet,* have not fallen so mournfully under its effort, or *as yet* brought forth such bitter fruits of an evil heart prone to *sin,* as, at an early age, Reformatory Committees mournfully witness, among *many* who have received previous instruction in National, Sunday, and other schools.

THE LONDON POOR.

There are few subjects on which those who interest themselves most deeply in feeling, are more helplessly ignorant in facts than that of the real objects of relief among the London poor. This the recent correspondences in the *Times* show very plainly. The fear of doing harm is sooner or later engrafted on most people's desire to do good; and as individual benevolence encounters imposture, it becomes, if not chilled, checked and baffled, and either hands over all its alms to public charities, or insensibly diverts altogether from the poor such as were given privately. All that in agricultural districts passes direct from the rich man's house or hand to the poor man's, to their mutual benefit, is in the wilderness of London destitution obliged to be transmitted through some third hand.

Upon the loss of that mutual blessing to giver and receiver we need not enlarge. It is an inevitable state of things in city life, and no statement of its evils will convert the mansions in Belgravia and Tyburnia into manorial halls, or the crowds in the adjacent "slums" into an individualised tenantry. Such a separation of classes may be bad, but an indiscriminate transfer of money from one to the other would not make it any better.

What we desire to urge is, that for want of a third hand much remains untransferred that is urgently needed by the destitute, and would be little missed by the wealthy. The response made to letters in the *Times* from various clergymen in poor districts shows that the ordinary machinery of such transfer does not adequately relieve either the wants of the poor or the consciences of the rich.

Upon this question of the means of transfer the debate in the *Times* turns. Mr. Bromley's Society asserts that the existing machinery is insufficient; its opponents, that the charitable societies existing *are* adequate for the work, and that this new society is officious and dangerous.

We are bound to judge of the society by its own statement, as given by Mr. Bromley at the meeting at the Thatched House Tavern a few weeks since. That statement was in substance as follows.

The first distinctive feature of the society is, that its entire expenses shall be defrayed by the committee, thus enabling every contributor to the relief fund to feel that the whole sum contributed goes untaxed to the relief of distress.

The second is that the society shall be broad and universal in character, guiding its charities by no influence of religious or national distinctions.

Thirdly, that the recommendation of all persons, whether subscribers or not, shall be uniformly attended to at publicly advertised houses of relief in every district.

Fourthly, that the society shall co-operate with all existing charitable and religious institutions, the clergy, and the ministers of all denominations, as also with the magistrates, that imposture and neglect may alike be guarded against.

The machinery for carrying out the work of the society is to consist:—

First, of a General Committee, by whom all expenses of mangement are to be defrayed.

Second, a Central Board of Management, composed of members of the General Committee, who would make such arrangements as should secure the presence in London of a sufficient number of members at all times of the year, to ensure the efficient working of the society.

Third, District Committees, consisting of such residents in the various localities as would be prepared to give their gratuitous services.

Fourth, Visitors.

Fifth, Volunteers, agents of existing societies, &c.

It is difficult to find fault with these plans: they are wide, and broad, and good, and if they fall short in operation, we hope it will not be by the mistaken zeal of those true and honourable workers among the poor who would have *all* relief of bodily want accompanied by some mission to the spiritual destitution that often exists with it. If the catholic spirit of the second and fourth principle above stated is not responded to by those who now are doing much that the society plans to do, on them will rest the burden of crippling its good intentions. The parochial clergy are already carrying out the first plan of the society—that of handing on money given through *their* hands untaxed, and though neither they nor any ministers of any creed could honestly distribute congregational alms among any but the household of the faith of the givers, no such restriction lies on their co-operation with a society bound by no ties of caste or opinion, and which society will strengthen or weaken their hands among their poor precisely so far as they open or close the door of communication.

So far as this society succeeds in cementing the operations of other societies, so far it will supply a need no more limited and specific agency can meet. There are societies enough and workers enough to bear with considerable weight even on the mass of physical and moral misery that seems overwhelming as we walk through some even of the less horrible of our London districts; if these workers could communicate *facts* and suppress their feelings altogether for the public benefit.

There is in every parish a district visiting society, and that society is worked by

Digitized by Google

volunteers, and if they are well organised and communicate systematically with each other they might collect and impart valuable information. Such information registered at the Relief Society's local office, would be an important foundation for its operations in a given district.

Then there is a far more important personage than any district visitor, the relieving officer, and his information must be, as to facts, authentic. There is the parish doctor, too; he sees and hears much that is hidden from the clergyman or his messengers.

These are only local agencies; the wide circle of Metropolitan Charitable Societies will also surely be open to the inquiries and aid of the Relief Society, which should, by the knowledge it acquires by the former source, be able to guarantee fit objects for the benefits of the latter.

A communicating link between all specific agencies for one broad work of charity is what we need, and how far this new society will be able to become that link, depends on those already established agencies. If they welcome it as free to work on broader principles than the terms of their own charters — so to speak — will allow, and as fighting by their side, though not in their path, against misery and sin, they will find it a powerful co-adjutor. If they reject it, they will to a degree cause it, however unintentionally, to work against them, for lack of knowledge how to work with them.

The means by which the society proposes to carry out its operations are well organised, especially if the second clause be enforced, that of securing the presence of a sufficient number of members in London, at all times of the year, to carry on the society's work efficiently and consistently. The great difficulty in voluntary labour is the regulating its supply. A register of volunteers, including names and addresses, what they can do, and when they can do it, would be a great help to the managers in regulating and distributing their workers, both in forming the District Committees of Clause 3, and arranging for the presence of some members of each committee in their district throughout the year.

It is impossible to calculate the preparatory expenses of the Central Committee in this stage of the project. The mapping out of the whole of a metropolis into districts, and the assigning their requisite number and extent according to the localities, must first be accomplished. Offices for each must be rented, and some sort of paid agency must have charge of those offices. We see no other expense ttending the machinery of the society, and for the preliminary expenses, whatever they may be, 2,000*l.* had been already subscribed at the end of November. Therefore, we may reasonably hope that this scheme will not fail for lack of money, nor, judging by the list of its supporters, for lack of friends.

We wish that its success may reanimate a similar project, which, for want of this same money and these influential friends, was unable to make a beginning, when contemplated last autumn. This project originated at Langham Place, where the office of the Society for the Employment of Women has been thronged with so many inquirers, with every possible shape of inquiry on all charitable institutions, as to suggest to the bewildered officials that a separate office for registering and imparting such information would be as great a benefit to the inquirers as to the Secretaries of the existing offices at Langham Place.

It suggested itself to a lady who has given the best years of her life to voluntary labour for others, that if among the ladies who have time or money, or both, at command, a working body of poor visitors could be enrolled, and a competent secretary or directress be maintained, who should give her whole time and attention to organising their labours and opening communication with the Metropolitan Charitable Institutions, much practical direction might be given to the floating benevolence of women who know not how to make an unaided beginning. A meeting was held to communicate the project, but whether from the limited attendance, or the limited charity of those who did attend, no response to the proposal was elicited.

OVERCROWDED DWELLINGS.

The remedy of a social grievance in England may be slow, but it is sure, when once the majority in public opinion recognises it as such. Social grievances unrecognised and unredressed will exist to the end of time, but once owned as wrongs by the British public and the *Times*, they will be righted sooner or later.

The shameful condition of agricultural labourers' dwellings has for some weeks been brought before public attention. We wish we could think that the cases quoted were extreme and exceptional, but we know that they are not. Two bedrooms are the ordinary allowance to a labourer's cottage in some of the midland and southern counties, and those eked out of such space as is afforded over the one room below; and, perhaps, some sort of lumber closet adjoining the living-room. One of these bedrooms is generally shared by some farm lad lodger, and even when appropriated to him and the boys of the family, there often remain girls of any age to be disposed of in the parents' room. This is often the case in a decent family, where the mother would be "tidy" if she could, and where—from the warping pressure of custom and poverty—the parents have no perception that they are doing other than the best for their family.

It is on the case of the well-disposed tenant of a farm cottage that we wish to dwell. That of the thriftless and reckless, who would only value another room as another lodging to let, is too wide for present consideration. Some plans for restricting the evil of their voluntary overcrowding have appeared in various letters in the papers; but, besides being somewhat arbitrary for English notions, they are only practicable for those landlords who can realise—what in England holds very good—that "money is power."

Taking, then, the condition of a decent, steady labourer, who, belonging to a certain parish, must find his work within its boundaries, or forfeit his claim upon the rates of which few day-labourers can hope to be thoroughly independent. If the cottages in the parish belong to the landowners, that is, are rented directly of them or their agents, the labourer of good character and with constant work can certainly make his choice of such as there are; provided he values his lodging at the sacrifice of part of his bread-money, and cares not for a mile or two's difference in distance from his master's farm. Of course the chances are that he will choose the nearest and the cheapest cottage that he can find, and this is no argument that if a decent human dwelling were as near and as cheap he would not gratefully appreciate the difference.

If the cottages are mainly attached to certain farms, and rented of the farmer as a condition of service, or inhabited nominally rent-free in lieu of part of the rate of wages, the labourer is utterly helpless. This is the case in some districts, and generally with the worst results. The repairs of such tenements may nominally rest upon the farmer, but really they accumulate with the dilapidations of homestead and farm-house until the good of the property requires attention to them. As to the good of the actual tenant, if a master keeps his waggoner's cottage weather-tight he is thought to do very well. As to improvements, why should he benefit his landlord's cottages when the labourers

Digitized by Google

complain of the rents as it is? and as to the wife's complaint that a mud floor, with an archipelago of scattered bricks, will not bear a washing without becoming flooded, the answer probably is, that she might be cleaner than she is. So she might, and healthier, and wiser, but has little chance of becoming either without a decent home about her.

The remedy lies in the principle, that the return for cottage improvement is not to be looked for in the rent paid by the cottager. It may be eventually, it cannot be at present. Neither can the landowner, sometimes crippled by his forefather's mortgages and debts, be generous before he is just. The accommodation for the farm-labourer cannot always be what many of our landed gentry virtually make it, a free gift; laying out their money on cottage buildings as a duty, irrespective of any interest upon the outlay.

But there are certain outlays that *must* be made for economy's sake, let who will hold the rents, and be the holder ever so self-seeking. Let cottage-room once be proved among the items of these outlays and each individual farm throughout the land might be supplied with it according to its acreage.

In every county and district the average number of regular farm servants for a given size and nature of farm is well known, as well as the proportional number and extent of the farm buildings. Let cottages for that number be recognised as a necessity, each labourer being reckoned upon as a married man requiring a habitable kitchen and out-house, and three decently divided sleeping attics above them, and provided accordingly. Let the cottages be included and specified in the farm-lease, and the farm-tenant be bound to let them at a given rent, to be regulated by the ordinary cottage rents of the district, not the cost of the new or improved cottages. Agricultural districts are not so thickly populated as to afford much temptation for evading this agreement.

For instance, if a farmer agrees to let his cottages at 2*s.* a week, and the rate of wages be 12*s.*, he will give his men, in money, 10s., and a receipt for rent every quarter. It might happen, certainly, that a farmer would give 9*s.* or 8*s.* in money, and make the receipt for rent a burden on his labourers; but we repeat that the press of labour in country places is not great enough to cover such an evasion. The same inspection that is given to the state of farm-house and stead extended to the cottages, a few fair questions asked of the cottagers as to rent and wages, and a few compliments on a well-kept dwelling, would facilitate fair play, without offence or injury to the master. In justice to him the cottager should be but a monthly tenant; in justice to the labourer, the loss of his place should not make him homeless on a day's or a week's notice.

There may be great practical difficulties in carrying out such a plan as this, and one is, that the farm-tenant would reap the immediate advantage of a better housed set of servants, and the landlord would have to suffer the cost of providing improved cottages. But a tenant worth a lease would be as willing to pay a fair per centage on good cottages as on a new barn, and a landlord who looks to the real market value of his estate is often obliged to lay out money one year for which he gets no sensible return during the two or three ensuing ones. It is not supposed that any suggestions made on a limited personal observation of the evil working of the present state of cottages in many agricultural districts can be confidently offered. Those who have watched and worked among farm labourers and their families know best how slow they are to like a change, even for the better.

But a hearty love for country children, and a painful recollection of how many honest and pure boys' and girls' faces became darkened and deteriorated as the want of a home worth the name, tempted them to unlawful amusements (and, unhappily, the poor have few innocent ones) have dictated what has been said; and the remembrance of one or two cottage homes, where home did its work, strengthens the conviction that decent dwellings would do much to ensure a decent and self-respecting peasantry.

THE PRINCIPLES OF THE ABERDEEN INDUSTRIAL FEEDING SCHOOLS.

By Alex. Thomson, of Banchory.

Statement of the Principles on which the Aberdeen Industrial Schools were Founded, and on which they have been hitherto conducted.

When a skilful physician is called to visit a new patient, his first duty is to inquire into all the symptoms of the case, and his next is to endeavour to find out the producing causes of the malady, and until he has done this he cannot hope to prescribe with success.

In like manner, if we desire to effect the cure of moral diseases, the first step is to ascertain distinctly the nature and peculiarities of the symptoms, and next to find out the proximate producing causes; until this is done we only labour in the dark.

This, then, is the course to be followed in endeavouring to ameliorate the outcast juveniles of our land, those foul blots on the face of our social polity.

When we get hold of a neglected little boy, what are the symptoms we discover? Those which first meet the eye are—that he is half-starved, half-clothed—that his physical development and his mental training have been equally neglected, and that not a trace of religious instruction has ever been imparted to his heart—that the principal training he has received has been instruction in vice and wickedness by his older comrades. The case is obviously about as bad and desperate as it can be.

The next inquiry must be, how has it been produced, what special causes have been at work? To this question several answers may be given, each partially explaining the case; but for practical purposes the whole may be comprised in two words—*parental neglect.*

We have thus the symptoms of our moral patient, and the immediate cause of his disease distinctly before us. What remedies are to be applied? Though many and various, they may all be summed up in three words—*Christian parental care.*

The obligation which rests on parents to take care of their offspring is probably more universally admitted than any other which can be named, and though multitudes fail grievously in the manner in which they discharge it, still very few go so far as to deny their responsibility.

But when we search into the state of the juveniles who supply the criminal population, we find that parental care, in the proper sense of the words, is almost unknown to them.

Some parents seem to think that if they supply the bodily wants of their children for the first few years they have done all that is required of them; others go a little farther, and add the first elements of knowledge, either themselves, or by means of an infant school, but will not spare their children for school attendance, so soon as they are able to do any sort of work *at home.* Other parents send them to work *from home* at a very tender age, and unfortunately for the rising generation, various kinds of work have been of late invented at which mere infants can be employed.

Few, indeed, of the children of the lower and lowest classes are brought up as they ought, or as they might be, either physically or mentally; but while we say this, it is far more in sympathy with both parents and children, than in unmitigated condemnation of the parents. They are clearly not doing what they ought to do, they are sowing a crop whose bitter fruits will assuredly be reaped by their children in after years, and yet in many, perhaps in the great majority of cases, they are more to be pitied than blamed; they are under pressure of circumstances beyond their own control, and which go far to make the right treatment of their children an impossibility. Before we blame poor parents too severely, we may well ask the wealthy, would they act better to their offspring were they placed in like circumstances of difficulty?

There is one grievous family error which pervades all classes at the present day far more than in former times, and that is, that children are not now trained up in conformity with the Fifth Commandment as they ought to be, and as they were wont to be; they are not taught to "honour their father and mother that their days

Digitized by Google

may be long in the land." In olden times the error of parents seems to have been to carry out this commandment beyond its scriptural meaning, and in modern times it is too often forgotten altogether, and children of all classes are allowed to grow up without either honouring or obeying their parents.

Now this is a matter of duty which lies within the power of all parents; all can enforce obedience kindly, but resolutely, and all may rest assured that no child, whether rich or poor, can go into the world with worse preparation for its duties and its trials, than a habit of disobeying and disregarding father and mother.

How, then, is the necessary remedy to be applied in the case of the outcast children? It is too obvious that there are tens of thousands of children in our land who are not properly brought up, who are prepared in early years for a life of crime and misery, and for nothing else. Were all parents able and willing to do their duty, there would be no room and no need for our interference.

If we could get at the parents, and by any means constrain them to do their own work, then, also, there would be no room for our farther interference; but in the present state of society, this is plainly an impossibility. We are, therefore, shut up to the necessity of stepping in betwixt the parents and the children, and taking upon ourselves the discharge of a certain portion of the duties of the parents.

Here we find ourselves at once in a very serious difficulty. Have we a right in any case to interfere at all, and take upon ourselves the discharge of any part of a duty which God has primarily laid upon others and not upon us? and if we have satisfied ourselves that we are entitled and called upon to do so, then what portion of the parental work can we undertake without risk of doing hurt to those whom we wish to benefit?

Are we to undertake the whole, or are we to do a part only, thus not working altogether *for* the parents, but rather *along with* them, taking them with us, and doing no more of their work than is absolutely necessary to prevent the children from perishing?

These are very serious questions, and they are full of practical difficulties. This problem is precisely that which the Industrial Feeding Schools have endeavoured to solve, and which their promoters think they may now, after nearly twenty years' of experience, safely, humbly, but firmly say they have accomplished.

They think they can now tell what requires to be done; how much parents even in the lowest ranks can themselves do, and how much the managers of the schools must undertake for them with no injury to the parents, and with much advantage to the children and to society.

There is on one hand the danger of doing too much, which is detrimental to society; and, on the other, of doing too little, and thereby not effectually benefiting the children.

We find in any locality a multitude of neglected children, and certain benevolent individuals desirous of caring for them. What is it which they have to do for them? We repeat it, simply to undertake the whole or a part, as the case may be, of a parent's work. This is to incur a grave responsibility, one which ought not to be lightly undertaken, and which, once undertaken, must never be abandoned until the work be completed.

On what principles are we to proceed in the discharge of it? Have we any sure guide in all the difficulties and perplexities which we have to encounter?

We rejoice to know assuredly that we have, and that the only guide we need is the infallible Word of God, the only means by which either rich or poor can be made truly wise, which has been given to us for the sole purpose of bringing outcasts back to God, and communicating the only knowledge by which high or low in society can be made truly happy. It is the way which God himself has chosen for the purpose, and it is vain and childish in man to seek for any other.

Taking, then, the revealed Word of God as our guide in every detail, we would lay down three general principles for our treatment of neglected juveniles.

Our first principle is *not to do more for any child than is absolutely necessary.*

This may seem a harsh principle to start with, but consideration of the first principles of human nature, amply corroborated by experience in our Industrial Schools, prove it to be sound.

Our second principle is *to act along with the parents;* let them continue to do as much as possible for their children, but let the Schools step in and supply whatever more is needful for the right upbringing of the children, and do whatever the parents cannot or will not do.

The third principle is *that the whole work be done with firm unwavering kindness,* or, in other words, that love be the moving principle of every action in the schools.

These three simple principles will be found large enough to embrace all that is needful for the management of schools for our outcast juveniles, for they are applicable to every possible case, and they only express in another form what we already stated as needful for the children—Christian parental care.

If we look for a moment at what education of children ought to be, we shall more clearly appreciate what the neglected classes require.

All children bring one nature into the world; some are more beautiful, more engaging than others, but essentially they are all the same, the descendants of fallen Adam. The whole purpose of God's dealings with man, from the fall to the present hour, has been to bring back his wayward erring children to Himself. This has been the end and object of the various dispensations He has established on earth; and the work which man has to do in preventing crime is to make use of the various means which God has appointed, and apply them all faithfully and diligently.

The same principles, though not the same details, must be employed for the godly upbringing of the child of a peer and the child of a criminal. What do all children require? Food, shelter, clothing, education. Without the three first, their earthly career will be very brief; and without the last it will be very useless or very mischievous. No one will dispute the necessity of the three first to all, varying according to rank and circumstances; but in whatever form, still simply, food, shelter, and clothing. The last, education, is now admitted to be indispensable to all; but though there be this harmonious agreement as to its necessity, there is marvellous diversity of opinion as to what education is. Men are tolerably well agreed as to the word, but they greatly disagree as to its signification. One very common notion is, that if a child be taught reading, writing, and arithmetic, then he is educated. This is a complete mistake; these requirements are only means to an end, and unless the child be further taught how to employ them, he might as well, or perhaps better, have been spared the trouble of learning them. A boy may be taught to read, and only use his power to read bad books, which poison his soul,—he may use his power of writing to commit forgery, and his skill in arithmetic to falsify accounts. These arts are, nevertheless, *essential* in the present day—without them none can maintain a respectable place, even in the lower ranks of society—but they do not constitute education.

What, then, is the education which Christian parents give to their children? To educate a child in the true sense of the word, is to cherish and give a right direction to every power and faculty of body, mind, and soul.

This definition of it includes teaching the necessary arts already named; but it includes much besides, and of much more difficult achievement.

Food and clothing, shelter, and active, joyous exercise, will suffice for the body, and if only placed within easy reach, will, without fail, be willingly turned to their proper use by every child. It is far otherwise with the educating of the mind and soul. There the pristine beauty has been defaced, and what was originally straight has been made crooked; and the heart of a child naturally rebels against endeavours to remedy the evil; they are wholly distasteful to it.

God has established one great institution for training children—*the family*—with all its duties, its privileges, and its endearments.

In a well-ordered Christian household, the right training of children goes on smoothly and vigorously, while the most valuable part of it is accomplished without direct effort, by the marvellous influence of mind upon mind, and heart upon heart. How different are the circumstances of the outcast juvenile and the child of wicked parents! They have no Christian love and tenderness brought to bear upon them, while evil influences of every description are pressing them into, or detaining them in, the broad way which leads to destruction. If we are to do them effectual good, we must follow the plan so clearly indicated by our heavenly Father, and endeavour to provide for them a system of training which shall, as nearly as possible, make up what they have not, the blessing of a Christian home. The whole of this work is obviously embraced by the three principles which we have laid down.

When we come to take charge of the

Digitized by Google

outcasts of any district it will speedily appear that there is much diversity in the circumstances of the children, that some parents are able and willing to do more than others, and the work which devolves on the managers of the schools must vary accordingly. All are not equally destitute; some require to be clothed and lodged as well as fed and taught; others are at least partially clothed, and the greater number probably may lodge at home. One thing all need, and all soon appreciate, though it is to them a new thing, and that is, considerate kindness. This alone it is which gives the teachers power over the children, wins them over to confidence and love; and this must be in ceaseless activity, else no good can ensue. Considerate kindness implies stedfast, immoveable firmness; the most wayward outcast speedily feels its power, and gradually submits to its influence. After true religious principle, it is the most important of all qualifications in a teacher, and without it the best principles will wholly fail; an unguarded threat, or a rash blow, will undo the work of months.

These being the principles to be kept in view, and the object to be attained, other principles not so universal, but still absolutely necessary in their places, come into operation.

Strict economy in all arrangements must ever be maintained. It is unnecessary to argue in favour of this, for all will at once admit it, and yet experience proves that there is daily temptation to forget it and to incur unnecessary outlay in every branch of management. Happily, in general, the want of funds has been a salutary check on thoughtless philanthropy.

The buildings (appropriated to an industrial feeding school) ought to be of the plainest and cheapest description. If new, everything should be solid and durable, but without ornament; if old, they must be at least substantial, and whether old or new must be thoroughly clean, well ventilated, and well drained. They must stand amidst the children who are expected to attend: if at a distance they are comparatively useless. A spacious playground is almost indispensable, and, if attainable, garden ground is also highly desirable.

No school ought to be capable of containing more than from sixty to at most 100 scholars. Whenever the attendance gets above 100, open another school; the additional expense will not much exceed the rent of the school-room, for the additional teachers and attendants will be absolutely necessary either in the old or the new.

The great instrumentality at work in an Industrial School, is the influence of the teacher's mind upon each pupil; extend the numbers too far, and this becomes so diluted as to have little or no effect. There ought to be much more close constant watching of conduct, and studying of character, than in an ordinary school, and this is wholly inconsistent with very numerous attendance. It must never be forgotten that the children in these schools receive all their moral training in school, they get none at home, and this is one of the essential differences between them and the pupils in common day-schools; therefore, there ought to be more of moral influence brought to bear daily and hourly on the scholars.

It is not an easy task to manage well a school of children who have all ordinary advantages in the way of training and care at home, and it is far more difficult to conduct aright a school composed of those who have had no training at home, but what is wholly evil, and the work can only be effectually done with a limited number.

Personal cleanliness is one of the first lessons to be taught in the school, and it is not usually very palatable, but after a few days it ceases to be disliked. Clean hands and faces, and smooth hair, ought to be strictly insisted on; and if not brought to school, must be effected there before entering on the duties of the day.

The duties of the day must, as a matter of course, commence with religious exercises, reading a suitable portion of God's word, praise, and prayer. Without God's blessing, the work of the day will be of little value; and teachers and taught should join together in imploring it. The service must be simple and short, for no other would be suitable; but it ought to be gone about as the most solemn work of the day; and on the right performance of which the success of all the rest must depend.

In the case of the outcasts with whom Industrial Feeding Schools generally have to do, the parents are either unable or unwilling to supply their children with necessary food, and this part of the parents' work must be undertaken for them. It is true that in a great proportion of cases it is the parents' fault, either through intemperance or wasteful carlessness; but whatever be the cause, the children must not be allowed to suffer on account of it.

The food is an *essential* part of the system, and to furnish it is neither so difficult nor so expensive as those who have never tried are ready to suppose. It ensures regular attendance without further trouble; it enables the pupils to profit by their lessons, and to apply to them with vigour, which no child suffering under the pangs of hunger can possibly do; and it is felt by children to be real substantial kindness. It is also truly acceptable to the parents, to whom it indirectly affords assistance in a form which they cannot easily misapply.

The food provided should be nutritious, but of the plainest description, nicely prepared, and served up with neatness and cleanliness. That it be nutritious is needful for the health and growth of the children; its plainness is desirable for economy, and, yet more, in order that it may be such as the children may most easily earn for themselves by their own exertions after leaving school. That it be served with neatness and the strictest cleanliness is indispensable, for it practicably teaches a most important lesson. The child accustomed for years to have his food at school served up in a slovenly fashion will not readily establish habits of neatness in his own home. It must be kept steadily in view, that whatever the child sees daily practised at school ought to be such as is proper to become the ordinary rule of his personal conduct in after life.

The food in common use in the families of industrious labourers will be found to be in general the most suited to the locality; but it will vary in different parts of the country, and each school ought to adapt the dietary which is found to be most suitable for itself. The substantial oatmeal porridge, with milk in abundance, which furnishes the cheap breakfasts and suppers in Scotch industrial schools, would be far too costly in London, and probably not acceptable to the children.

The next thing wanting to outcast children is ordinary education, without which, their progress in life is hopeless, and which their parents do not provide for them. It must include the ordinary branches of reading, writing, and arithmetic; and it ought also, as far as possible, to teach *common things*—a matter of the highest importance to all—though hitherto most strangely neglected, even in schools for the higher classes. Geography, and the leading facts of natural history, illustrated by maps and diagrams, and outlines of civil history, are eagerly learned, even at a very early age. The great thing to be kept in view in these, and indeed, in all schools, is, so far as possible, to impart to pupils the power and the desire to add to their knowledge so long as they live; this is the true end of all teaching. The true test of the value of a school is, not so much what is there actually taught, as what that teaching enables and induces the pupil in after life to learn for himself.

Another portion of the parents' work to be undertaken by industrial schools is that of training the children in habits of persevering industry by useful, and, if possible, remunerative employments. This is a training they will never get at home, and which is indispensable to their success in after life.

The industrial work must vary in different parts of the country. One sort will be found more profitable, and more useful, in one place, and another in another place; and the managers must act in this as circumstances dictate. There is much inducement to obtain work which pays; it makes the annual accounts look well, and forms a capital paragraph for the report; but still it is not the principal object: the great purpose of the industrial training is to form habits of steady perseverance at work, and to teach what may be of use in after life as a means of self-support; and immediate profit ought to be considered as a secondary object.

One of the great advantages which was derived from Government capitation grants was, that they made it less necessary for managers of schools to give undue preference to present profit, and enabled them more easily to follow up the training calculated to do most ultimate good.

It is to be regretted when oakum-picking, wood-splitting, and other similar occupations which are not likely to be pursued in after life, enter largely into the work of a school; but it often cannot be avoided, and work of any kind is far better than none; and even these are excellent for beginners, as the first steps in industrial pursuits. Tailoring and shoemaking are good for boys; for, if they do not become their permanent supporting trades, they enable them, especially if they emigrate, to do much for themselves.

Sewing and knitting in every branch are

Digitized by Google

the great occupations for girls, and there can be none more suitable. Unfortunately, school sewing rarely pays until after several years of teaching. They ought also to be trained up as much as possible in doing all the household work of the school; sweeping and putting in order can be taught at a very early age, and the older girls ought in turn to be employed in cooking, and, if possible, in washing and doing up clothes.

Shelter or lodging is imperatively required for all children. This at once brings up the great question as to whether the schools ought to furnish lodging or not.

The first impression naturally is, that it must be desirable to remove the children at once from the evil influences and associations of their homes, and keep them wholly under the care of their teachers. Further consideration, however, shows, that to do so would be at once to place them in circumstances nearly identical with hospital children, an artificial mode of treatment, which ample experience in Scotland has proved to produce the most unsatisfactory results at the most enormous expense.

The evil of hospitals lies not in the management of them, which is often as good as can be, but in the system itself, which no management can cure. What can be more preposterous than to find the finest edifices in our towns erected and maintained at vast cost for the education of the poorest children of the community, at least of those whose parents are supposed to be so poor as to be unable to educate them?

Taken from want and penury, they are placed suddenly in the midst of abundance—food, clothing, and lodging, of the best description, supplied to them without an effort on their part. Here they are kept for years, carefully taught the common branches of education, and then turned out into the world to make their way in it as they best can, without the possibility of having learned a single practical lesson fitted to enable them to struggle against hardship and privation.

Such a system is precisely analogous to that of a farmer who would raise his crops in the artificial heat and warmth of a hotbed, and then transplant them to the open field to encounter the biting winds and frosts of winter. Doubtless his plants would flourish wonderfully for the time in the hotbed, just as children do in the hospital; but both being devoid of the strength and firmness required for their permanent place of growth, this mode of rearing, whether of crops or of children, must turn out altogether unprofitable to the community.

Family ties are the foundation laid by the Creator himself for the good order of society; whatever tends to break them up—to separate children from their parents, brothers from brothers and sisters—must be evil. Looking at these great hospitals, they have often struck us as something very like monasteries and nunneries for boys and girls. It may seem strange to speak of such things in Protestant Britain; and yet, in not a few important points, these hospitals resemble the monasteries of the Church of Rome. There is, for the time, the same breaking down of family connections, the same seclusion from the world, the same process of unfitting for the active business of life, the same providing of all necessary supplies, and even superfluities and luxuries, without a thought or an exertion on the part of the recipient; and, may we not add, there is the same most hurtful prevention of that right and proper intercourse betwixt the youth of the two sexes which we hold to be essential to the godly upbringing of boys and girls of every rank?

This matter was the subject of much consideration when the Industrial Schools were first opened. It was said, and some of the managers shared in the feeling, that if the children were permitted to return home, the good done at school during the day would be all undone at night—that the polluting influence of their miserable homes would more than counteract the training of the school; and it is probable that, if funds and other circumstances had permitted, the attempt would have been made to lodge the pupils. Fortunately for the cause of Industrial Schools, it was impossible to make the experiment; and the result of nearly twenty years' trial proves that the cases where evil results from the children returning home are very rare, while, on the other hand, there have been most cheering instances of substantial good having been carried by the child from the school to the other members of the family. There are few parents, especially mothers, so abandoned as not to be touched by kindness shown to their offspring; it is the direct road to the mother's heart. Show kindness to her child, and she is prepared at once to second your efforts in its behalf. She must be debased indeed who will not listen to her child repeating its text from the Bible, or singing a verse of its infant hymn; and by such means the first seeds of a new life may be, and have been, planted in the parent's heart.

Cases do occur, though rarely, where the parents are so utterly depraved that they value their offspring only for the sake of the wages of sin which they may daily bring them, and then it is needful to separate them; but it is not needful, therefore, to shut them up in an hospital. Let them still enjoy the advantages of a family by boarding them with respectable persons, and not more than two or three in one house; and the same plan ought to be followed with orphan and deserted children, in place of gathering them in crowds into poor-houses. Every town and village will furnish abundance of suitable parties thankful to receive such inmates.

Clothing is another requisite for children. This is not professedly furnished by the schools, but in all cases of absolute necessity clothes are somehow or other procured, without encroaching on the school funds; and specially this is done by the ladies for the girls.

In this manner and to this extent the industrial schools supplement the work of the parents doing what is absolutely required for the children, and nothing more; and thus do they occupy the exact province which belongs to them, and they must fail in their purpose if, on the one hand they do not fully occupy it, and if on the other they go beyond its boundaries.

This treatment is applied for twelve or thirteen hours of each day. The scholars assemble every morning, at seven in summer and eight in winter. The school is opened by reading the Scriptures, by praise and prayer, and by religious instruction suited to their years; after which there is a lesson in geography, or the more ordinary facts of natural history, taught by means of maps and prints distributed on the walls of the school-room. Two days in the week they have a singing lesson. At nine they breakfast on porridge and milk, and have half-an-hour of play. At ten they again assemble in school, and are employed at work till one or two; then they dine, usually on barley broth with coarse wheaten bread, but occasionally on potatoes and ox-head soup, &c. The diet is very plain, but nutritious and abundant, and appears to suit the tastes of the pupils completely. It is a pleasing sight to see them assembled, with their youthful appetites sharpened by four hours' work, joining, with outward decorum, in asking God's blessing on the food he has provided for them, and most promptly availing themselves of the signal given to commence dinner. From dinner till three the time is spent in exercise or recreation. From three to four they work; and from four till seven they are instructed in reading, writing, and arithmetic. At seven they have supper of porridge and milk, and, after short religious exercises, they are dismissed to their homes at eight.

On Wednesday and Saturday they do not return to school after dinner; and occasionally, as a reward of good behaviour, they accompany the teacher in a walk to the country or the sea-coast.

On Sunday they assemble at half-past eight for devotion, breakfast at nine, attend worship in the school-room at eleven, after which they dine, and either return home, so as, if possible, to go with their parents to church in the afternoon, or attend again along with the teacher. At five they again meet, and have *Sabbath-school* instruction in Bible and catechism; at seven, supper; and after evening worship, they are dismissed.

It is not found by experience that they are apt to fall into temptation after leaving school for the day, for the succession of work and lessons, and food and play, have sufficiently employed their energies, and supplied their cravings; and they are, as children at night ought to be, ready for bed, and desirous of nothing else.

It is very unfortunate for the cause of our outcasts that the question of their religious training has been made the subject of keen controversy. Religion is the essential part of the whole system, and if it be neglected, all the rest can profit little. Other systems and modes of teaching may produce decent, respectable, external conduct, but they leave the heart untouched.

We conclude by repeating what we stated at the commencement of this paper, that the ground work of the whole system of training in our Industrial Schools must be the Bible—the revealed word of God. That Blessed Book is the palladium of Great Britain, and the free unrestricted use of it is the inalienable birthright privilege of every British child.

Reviews.

Popular Education: What it is, and what it is not. By M. A. B. London: Bell and Daldy, 186, Fleet-street, 1860.

THE practical purpose of this pamphlet is, to urge that a national system of education should be compulsory, that it should be under State management, and supported by a general rate.

The popular objections against State interference on the point are fairly stated and reasonably met; but reason makes little way against prejudice, especially national prejudice; and in England national prejudice is rather strengthened than weakened by even an unfavourable difference from other nations. It is perfectly true that in almost all of the civilised nations of the Continent the State secures a better education to the labouring classes than the voluntary system affords to the average of them in England; but to a member of what may be termed, in the language of the day, the *difficult* "classes" to argue with, this fact would afford no satisfaction when compelled to send his child to a Government school or to pay a rate for supporting that school.

While cordially agreeing with the authoress that our present machinery for popular education cannot be called an efficient national system,—failing to help those masses of the nation who most need help,—we see insuperable objections to State compulsion as a means of amending it. State interference in the shape of State help we must have, and if that help were given in establishing free public Government schools, instead of in denominational grants to private foundations, it might be better. The tax proposed in page 8, namely, a general rate of 3d. in the pound on the rent of all householders above 20*l.* per annum, does not seem unreasonable as compared with poor-rate; but it must be remembered that many of these householders are contributing already to the education of the poor, according to their individual judgment of how that education ought to be supported and conducted.

We have a proverb to the effect that there is nothing like buying your own experience, and it is one upon which the English public has acted very liberally on many points, and will probably act on many more, National Education among the number. The standard of intellectual requirement for certificated masters and mistresses has been raised too high. Of the practical ill consequences of that strained standard we have spoken before, upon the evidence collected at the Glasgow Meeting. But the governing classes are not "the difficult classes" to convince, and to whatever extent this standard is proved erroneous it will be altered, probably by concessions to the general demand arising for some combination of industrial with intellectual education. A requirement of industrial capability would effectually exclude any candidate who seeks the office of a school-teacher as a mere stepping-stone in social rank.

In Mrs. Baines' remarks upon religious instruction we heartily sympathise; and in those upon *Physical Education*. To the following all will assent who have ever had practical experience of teaching or learning in crowded school-rooms:—

"Ventilation of school-rooms, and many other subjects relating to hygiène, must have attention, in order to make school-work go on satisfactorily and pleasantly. More than half the *dulness* often complained of in children arises from physical causes rather than from any real or natural defect in their mental capacities."

A Chapter on Slavery: Presenting a Sketch of its Origin and History, with the Reasons for its Permission and the Probable Manner of its Removal. By the Rev. O. PRESCOTT HILLER, Author of "God Manifest," "Practical Sermons," etc. London: Hodson & Son, 22, Portugal Street; New York: Mason Brothers, 587, Mercer Street; Boston: Otis Clapp, 3, Deacon Street. 1860.

THIS work, far exceeding *a chapter*, is so entitled from its subject-matter having originally been intended to form part of another work lately published by the same author.

The question of slavery is one that needs no discussion or comment in the pages of a British journal; but all our sympathies against it must, in any practical consideration of its position in America, be warmly enlisted with the American philanthropists, who see daily around them, as plainly as the horrors of its existence, the dangers and difficulties that attend its abolition.

These dangers and difficulties seem insuperable in any emancipation unaccompanied by emigration. This is clearly shown in Mr. Hiller's book, which treats the whole subject and history of slavery in the reverent and dispassionate spirit which can alone arrive at Truth. The first three sections, containing a review of slavery in the early and middle ages, slavery in Russia and in Africa, are full of facts and narratives taken from received authorities. Section four contains an account of the Republic of Liberia, which, with the inquiry in section five into the "Distinct Character of the Coloured Race," shows how the free black, despised, and too often self-debased and degraded among whites, may become all that his gentle and generous nature is capable of on his native soil—a soil on which no white man could maintain, far less enjoy, existence.

The sixth and last section treats of "American slavery, its origin, and the probable manner of its removal." That manner of removal brings us back to the colony of Liberia, *as emigrants* to which small detachments of slaves are in increasing course of liberation. We quote from section five passages from the writings of white and coloured advocates of the African's return to Africa, bearing responsive witness to each other:—

"In spite of opposition and obloquy, in spite of indifference and contempt, the cause of African colonization will at length, we believe, completely triumph. The free blacks of the United States will at length discover their true interests, will at length perceive that if they would consult their own real happiness, and the lasting good, moral and physical, of themselves and their children; if, in a word, they would become truly freemen, not only legally, but civilly and socially, they must separate themselves from the whites, and, go where they will, be in a community of their own colour and kin, and where they will be on perfectly equal terms with all around them. It requires but little thought to show them this; in fact, they know it already and feel it. The noble-spirited of them feel deeply their state of humiliation, and the more intelligent of them begin to perceive the only remedy for it. Africa, the home of their fathers, calls to them across the sea, and spreads her arms to welcome them. 'Here,' she says, 'is all you wish; here is a home, freedom, and happiness; here the colored man is in dignity and in power; here are no whites to frown upon you, to pass you by with disregard, to oppress or disturb you; here you may be not only a voter and elector, but also yourself eligible to the highest offices; here you may be a member of the Legislature, a judge, the Vice-President, the President himself, if you but possess the capacity and fitness. All places of honour and trust are open to you, all the professions, too, are free to you; here the lawyer, the physician, the clergyman, are all coloured men like yourselves, yet loved, esteemed, and honoured, looked up to for counsel and instruction in all concerns, whether affecting the body or the soul, whether temporal or eternal. Here, too, the avenues to wealth are all open, the merchant, the shipowner, the landholder, are here all men of colour, yet possessing weight and influence in the community, gentlemen, respectable, and respected by all. Here everything is in abundance; comforts and luxuries invite you on every side. You may literally sit under your

Digitized by Google

own vine and fig-tree, with none to make you afraid.' In the soft evening hour after the duties of the day, and while the cool sea-breeze is breathing upon you, and the new moon is hanging in beauty over the western waters, you will look across that ocean, and—thinking of the land of the whites that lies beyond—you will bless the day you left it, to come to the home of your fathers, the rich country which Providence has set apart for the coloured race.

"While Africa is thus calling them, America is urging them away. Their presence is not desired by the whites; they are felt to be a foreign element in the body politic, one that cannot amalgamate with its system,—one, the removal of which is necessary to its safety, health, and peace. This feeling is founded, doubtless, on the intrinsic distinctions between the two races, which the Creator himself has marked. That Creator has divided mankind into distinct races; not two only, but many. At least five distinctions are, as we know, universally recognised by ethnographers, viz., the yellow or Asiatic race, the brown or Malays, the copper-coloured or American-Indian, the Negro, or African, and the Caucasian or white race. The mixture of any two of these has not in general been found for the advantage of either party.

"There are fundamental differences between them, not only in physical, but in mental constitutions. Mixed races it has been generally found are degenerate races.

"This being the case, it is evident that the repugnance felt by the whites at the idea of intermixture with the African race it is not a foundation in something real—in a feeling implanted, doubtless, for the very purpose of keeping the races distinct. Nor is this feeling by any means confined, in its directions, to the African race alone. Would there not be felt the same, or a greater abhorrence, at the idea of inter-marriage with an American Indian; with a Malay; with a Chinese? Thus we perceive, on a little reflection, that it is not a sentiment confined in its direction to the Africans. Nor is the existence of such a feeling by any means exclusively to be found with *American* whites, as has sometimes been unjustly charged. It exists with whites of all nations, who have been brought to any considerable extent into contact with the African race. It is found with people of all the different nations that possess the several West India islands—the English, French, Spanish, Swedes, Danes. All these have a similar repugnance to an amalgamation with the negro. There may be a slight difference in the degree of this feeling, the French and Spanish, perhaps, manifesting less of it than the others; but of all the whites, the Anglo-Saxon, whether the English in the West Indies, or the Americans in the United States, are most deeply imbued with it. In England itself, indeed, the feeling can scarcely be said to exist; and simply for the reason that there being few or no negroes in that country, there has been no opportunity for its exercise—nothing to call it forth or to produce it."

. . . . .

We will conclude this part of our subject by quoting the following eloquent passage from Mr. Freeman's "Plea," describing the present condition of the free blacks in the United States, and presenting, at the same time, a well-written memorial, adopted by the people of colour themselves at a meeting held some years since in the Bethel and African churches, in the city of Baltimore.

"Look at their unwelcome reception, wherever they go among the whites, and consider the fact that their presence is regarded as an evil wherever they are. To some States they are prevented from going by enactments, which expose them to a forfeiture of their freedom, if they should dare set foot upon the soil. Louisiana, some time since, required all free persons of colour who had removed to the State since the year 1825 to leave it. Thousands who had taken refuge in Ohio, driven out from that State, sought a home in Canada; but the result is that the Canadians in their turn have threatened their expulsion. They are laid under restrictions which cannot but be exceedingly painful, in most of the States, both North and South, and in none do they enjoy anything much better than a nominal freedom. Various expedients are resorted to by the States Legislatures to deliver themselves from a free-coloured population by disabilities and other embarrassments. The South casts them off, the North has no place for them, the West pushes them away, Canada threatens to expel them, and where shall they go? what shall they do? They are here isolated, they have no home of their own, no community of their own, no country of their own, no government of their own, no system whatever, intellectual or moral, in which their individual existence forms a part of the machinery, but every cheerful hope seems crushed. They are, I was going to say, dislocated from humanity. The free people of colour in Baltimore seem to have taken a correct though painful view of this subject in a memorial which is now before me. Addressing the citizens of Baltimore, they thus speak:

"We have hitherto beheld, in silence, but with intense interest, the efforts of the wise and philanthropic in our behalf. If it became us to be silent, it became us also to feel the liveliest anxiety and gratitude. The time has now come, as we believe, in which your work and our happiness may be promoted by the expression of our opinions. We reside among you, and yet are strangers; natives, and yet not citizens; surrounded by the freest people and most republican institutions in the world, and yet enjoying none of the immunities of freedom. This singularity in our condition has not failed to strike us as well as you, but we know it is irremediable here. Our difference of colour, the servitude of many and most of our brethren, and the prejudices which those circumstances have naturally occasioned, will not allow us to hope, even if we could desire, to mingle with you, one day, in the benefit of citizenship. As long as we remain among you, we must be content to be a distinct caste, exposed to the indignities and dangers, physical and moral, to which our situation makes us liable. All that we may expect is, to merit, by our peaceable and orderly behaviour, your consideration and the protection of your laws. It is not to be imputed to you that we are here. Your ancestors remonstrated against the introduction of the first of our race who were brought amongst you; and it was the mother-country that insisted on their admission, that her colonies and she might profit, as she thought, by their compulsory labour. Leaving out all considerations of generosity, humanity, and benevolence, you have the strongest reasons to favour and facilitate the withdrawal from among you of such as wish to remove.

"But if *you* have every reason to wish for our removal, how much greater are *our* inducements to remove? Though we are not slaves, yet we are not free. Beyond a mere subsistence, and the impulse of religion, there is nothing to arouse us to the exercise of our faculties, or excite us to the attainment of eminence. Though under the shield of your laws, we are partially protected, not oppressed; nevertheless, our situation will, and must, inevitably have the effect of crushing, not developing, the capacities that God has given us. We are, besides, of the opinion that our absence will, by the permission of Providence, *accelerate the liberation* of such of our brethren as are in bondage. When such of us as wish and may be able shall have gone before to open and lead the way, a channel will be left through which may be poured such as hereafter receive their freedom from the kindness or interest of their masters, or by public opinion and legislative enactment, or who are willing to join us who have preceded.

"Of the many schemes that have been proposed, we must approve of that of African Colonisation. If we were able and at liberty to go whithersoever we would, the greater number, willing to leave this community, would prefer Liberia or the coast of Africa. We shall carry your language, your customs, your opinions, and Christianity, to that now desolate shore and thence they will gradually spread with our growth far into the continent. The slave-trade, both external and internal, can be abolished only by settlements on the coast. We foresee that difficulties and dangers await those who emigrate, such as every infant establishment must encounter and endure. But 'Ethiopia shall yet lift up her hands unto God.' Thousands and tens of thousands, poorer than we, annually emigrate from Europe to your country, and soon have it in their power to hasten the arrival of those they left behind. If we were doubtful of your good will and benevolent intentions, we would remind you of the time when you were in a situation similar to ours, and when your forefathers were driven by religious persecution to a distant and inhospitable shore. An *empire* may be the result of our emigration as of theirs."*

MATRON.
Miss Hills.

BANKERS,
Messrs. Prescott and Co., Threadneedle-street.

The Committee earnestly appeal for aid to enable them to extend their efforts on behalf of this distressed and struggling class of women, whose condition they are desirous of improving over the whole of the metropolis.

There is now the opportunity (if the Institution be placed on a sound and permanent footing) of securing a large quantity of public work. But to do this the Committee must raise—First, such an amount of money as will enable them to establish a central depot for receiving and giving out work, and defraying the necessary superintendence; and, secondly, such a guarantee fund as will enable them to give the security which may be required for the performance of the work they undertake. They hope ere long to open branches in different parishes, and by deducting a trifling sum from the payment of the work, eventually make the Institution self-supporting.

The following gentlemen have already given their names as guarantees:—

The Earl of Fortescue	£100
Stephen Cave, Esq., M.P.	100
William Gladstone, Esq.	100
James Easton, Esq.	100
Philip Smith, Esq.	100

It is desirable that the list of guarantees should extend to about twenty names.

Gentlemen willing to aid in this important object are respectfully requested to communicate with S. Cave, Esq., M.P., 35, Wilton-place; the Rev. Sydney Turner, 15, Parliament-street; Mrs. Piers St. Aubyn, 35, John-street, Bedford-row; or the Honorary Secretary, Miss Ellen Barlee, 26, Lamb's Conduit-street, W.C.

The following donations have been received since the last published list:—

EDUCATION OF DESTITUTE CHILDREN.

THE Conference held at Birmingham, for the purpose of discussing the subject of providing for the education of neglected and destitute children, was opened in the presence of a large assembly, at Dee's Hotel, on Wednesday, Jan. 23rd. Sir John Pakington, Bart., M.P., was in the chair, and amongst those present were:—The Earl of Lichfield, the Earl of Shrewsbury and Talbot, Lord Calthorpe, Lord Lyttelton, Lord Ingestre, Hon. and Rev. G. M. Yorke, Sir Baldwin Leighton, Bart., M.P., Mr. R. Spooner, M.P., Mr. W. Scholefield, M.P., Mr. M. D. Hill, Q.C. (Recorder of Birmingham), Mr. R. Hanbury, M.P., Mr. A. Ryland (Mayor of Birmingham), Mr. T. C. S. Kynnersley, Dr. Bell (of Edinburgh), Mr. C. H. Bracebridge (Deputy-Lieutenant of Warwickshire), Mr. S. Thornton, Mr. T. Lloyd (ex-Mayor of Birmingham), the Rev. Dr. Guthrie (of Edinburgh), the Rev. Dr. Miller, Messrs. Gibbs, Chandos Wren Hoskyns, T. Kekewich, J. Jaffray, Butler (Inspector of Factories), C. F. Runcy (of Aberdeen), Corbett, Maher, H. W. Tyndall, J. R. Bott, W. Morgan, B. Smith, W. Akroyd (of Stourbridge), Collings (of Exeter), W. R. Lloyd, Sampson Hanbury, J. T. Birch; Revds. G. H. Hamilton (of Berwick), G. B. P. Latimer, J. T Birch, C. Brittain, J. H. Burgess, J. B. Gabriel, D. Ledsam, J. M. Aston, F. Williams, W. Gover, R. W. Dale, S. Bache, J. J. Brown, S. M'Aulay, R. Stephenson, C. Tucker, J. Kesler, R. E. Dunne, H. J. Heathcote (of Erdington), W. C. Osborne (of Bath), T. G. Simcox, H. T. Breay, and I. Spooner; Miss Carpenter (of Bristol), Miss Isa Craig, Mrs. A. Ryland, Mrs. S. Hanbury, Miss Martineau, Mrs. H. Hunt, Mrs. W. R. Lloyd. Amongst the representatives of philanthropic societies were G. W. Hastings, Esq. (secretary of the Social Science Association), Rev. E. W. Foley (secretary of the Derby Ragged Schools), Mr. A. O. Charles (secretary of the Reformatory and Refuge Union), Mr. H. J. Leppoc, of Manchester, Mr. Sword (secretary of the Glasgow Ragged Industrial School).

The meeting having been opened with prayer by the Hon. and Rev. Grantham Yorke, Mr. C. Ratcliffe, hon. secretary of the Preparation Committee, announced that Mr. M. D. Hill (the chairman of the same committee) and himself, had received many letters from distinguished friends of the cause of popular education, regretting their necessary absence from the Conference. Not a few of the writers, Mr. Radcliffe said, expected, until recently, to be present among them, and the loss of their assistance was deeply to be regretted. To read over even the names of all these correspondents would, he said, detain them too long from the subject of the meeting; he would, therefore, read some of those which were most likely to be known to his audience.

The Archbishop of Dublin (Dr. Whately), the Marquis of Lansdowne, the Earl of Shaftesbury, the Earl of Harrowby, Lord Brougham, Lord Leigh, Lord Stanley, the Right Hon. Sir John T. Coleridge, the Right Hon. Charles Bowyer Adderley, Sir Wm. Miles, M.P., Sir Arthur Elton, Bart., M.P., Sir Stafford Northcote, Sir Eardley Wilmot, Bart., Monckton Milnes, Esq., M.P., William Dickens, Esq. (Chairman of Warwickshire Sessions), Allen Thompson, Esq., Banchory, Sheriff Watson, Aberdeen, the Rev. Canon Moseley, the Rev. Canon Girdlestone, the Rev. Sidney Turner, Joseph Hubback, Esq., Adam Black, Esq., M.P., George Melly, Esq., Miss Nightingale, and many others.

The Hon. Chairman, after a few preliminary observations, said they had assembled together to consider what they believed to be a grievance, and to discuss what was its best remedy. The grievance was, that out of the large annual sum which was voted by Parliament to assist in the education of the poor, those who were the most poor, those who were the most destitute, those who came under the care of those institutions which had been founded by benevolent persons in most of the large towns of England and Scotland, those who, in fact, peopled our Ragged Schools, received nothing—were, in fact, excluded from that which professed to provide for them. They would be told by those in authority that they were not excluded, and that it was open to them to claim their share, but he had no doubt that before the day closed it would be made perfectly clear that practically they were excluded; that in those respects in which aid was offered it was saddled with such conditions as to make it generally undesirable that that aid should be accepted. They not only complained of this as a breach of national duty, but the arrangements of the Education Department had been such that they might complain of a breach of faith as well as of bad policy. (Hear, hear). A minute was at one time passed, and for some time acted upon, by which these Ragged Schools were enabled to get their share of the public money granted for education. But scarcely had they proved the benefit of this liberality, scarcely had they begun to make their arrangements, to extend their buildings, to purchase premises, and to avail themselves of the grants of money made them under this minute, than the minute was withdrawn. This being their grievance, their general principle and their object was, in the words of their circular letter:—"The welfare of society requires that all its members should be educated; therefore it is the duty of the State, both as regards society in general and each individual composing it, to provide education for those who *cannot* obtain it for themselves. This duty is recognised by the State, since it provides education for those who are in gaols and reformatories, and therefore come compulsorily under its care, and for those who are thrown on society for support, *i.e.* paupers. The same duty exists, but has not been discharged by the State towards children who are not yet either criminals or paupers, but whose natural guardians will not, or cannot, provide for their education. It is the object of the Conference to lay before the Executive Government and the Legislature, as a consequence of the principle above stated, the imperative duty of their providing education for this portion of the community, the neglected and destitute children of Great Britain." This paper, said the hon. chairman, bore the signatures of 146 of the most eminent friends of education in Great Britain, Scotland, and Ireland, who had supported the principle therein enunciated without regard to religious opinions or political party; and such a band of gentlemen, he thought, must be influential with the Government and with the Legislature. Having adverted to the fact that the Governments both of Lord Derby and Lord Palmerston had opposed the grant to Ragged Schools, the hon. baronet proceeded to state that he could not better put the meeting in possession of the facts of the case than by reading the terms of the motion he brought forward in the House of Commons last session, and by drawing attention to some circumstances that arose out of it. The motion was:—"That the grants annually made by Parliament for the promotion of education ought to be expended with a fair and just regard to the requirements of the different classes of schools recognised by the minutes of the Committee of Council; and that the Ragged and Industrial Schools, which are alone adapted to meet the wants of a considerable number of destitute and neglected children, do not receive the amount of aid to which they are entitled." He was of course answered by the Minister who represented the Education Department (Mr. Lowe), and it was with regret that he had to call attention to some remarks made by the hon. gentleman on that occasion. He said:—"When the right hon. gentleman (Sir J. Pakington) complained that under the present system, the higher class of the working classes was amply provided for, and the poorer class neglected, he complained of that which was the very essence and principle of the system. The system being a voluntary one, the rich would provide for their own neighbourhoods, and often to excess, and the poor who had no rich among them would be unprovided for." If, said Sir John, Mr. Lowe had desired to strike a blow at the system in existence, if he had desired to hold out to Great Britain that the funds liberally and amply supplied by Parliament were not devoted to those objects which they ought to promote, he could have made no statement more fatal to the department over

Digitized by Google

which he presided. For if it was thus openly avowed by the educational minister that for those who were most destitute they did nothing, they surely had the right to say that such a system required alteration. It was, then, this system, which administered the greatest help where there was the least need, and that where there was the greatest need gave no help at all, that they sought to remedy. His own opinion was, and he had avowed it over and over again both in and out of the House of Commons, that public aid to education would be more beneficially given, if they applied to the education of the humbler classes of society those same principles of local management—(hear, hear)—to which Englishmen were in other respects so much attached—which we had long applied to the relief of the physical wants of the poor, which we applied to the management of our counties and our towns, and which was, in fact, that system so much opposed to centralisation, and so much upheld as one of the principles of our constitution. (Applause). If properly constituted bodies were thus appointed throughout the length and breadth of the land, there could be no doubt but the educational requirements of all the poor would be properly attended to. (Hear, hear). And here again he must quote from his honourable friend Mr. Lowe :—"The right hon. gentleman said that the educational grants should be expended with fair and just regard to the requirements of the different classes of schools recognised by the minutes of the Committee of Council. This seemed a very fair proposition, but the practice of the Privy Council was not, and never had been, in conformity with it. And if the House affirmed the motion, they would lay down an entirely new principle of action, which would be subversive of all the principles hitherto acted upon by the department. The practice of the Committee of Education was not to give grants in consideration of requirements and necessities of the schools, but in consideration of private persons coming forward and supporting them." To this there were two answers. First of all, if such was the practice of the Privy Council, it ought to be changed; and, secondly, Mr. Lowe had fallen into a practical error. He said the practice of the Privy Council was to grant money in consideration of private persons coming forward. That was precisely what they were asking for the Ragged Schools; they had never asked that they should become entirely a burden on the public purse. But one thing he did regret more than any other in the speech of Mr. Lowe, and it was when he made a boast of the pecuniary saving which had been effected by withholding aid to these Ragged Schools. The charge upon the education department, it appeared, while this grant to the Ragged Schools was in existence was 27,000*l.* a year, but in consequence of withholding that grant, the amount was reduced to 5,500*l.*, and Mr. Lowe boasted that a saving of 22,000*l.* had been effected. He trusted that no one there would think the sum a large one for the purpose, but in the view he had long entertained as to the mode in which education should be assisted by the State, he felt certain that the day would come when, if this centralising system of doing everything from an office in London were adopted, the amount of that national grant would become so great that the Chancellor of the Exchequer would raise his voice against it. Already had this been seen in the course pursued by Mr. Gladstone, who was the first Chancellor of the Exchequer to openly speak against the grant, although others had not liked it a whit the better. But when they considered what had been done by these Ragged Schools, was 22,000*l.*, or even 27,000*l.*, at all too large a sum to spend out of the State funds in their support? The statement he held in his hand, and which he intended to read, would show what had been done :—"Upwards of three thousand children had attended the Aberdeen Industrial Schools since their commencement. Of these, six hundred have gone from schools into situations, and are, with few exceptions, known to be doing well; while of the others, there is every reason to believe that a very large number have not misconducted themselves. During the last few years the greatest possible change has taken place. Out of the thousand vagrants who were reported to be wandering in this part of the country, the whole juvenile population, calculated at nearly 400, have entirely disappeared. The juvenile offenders in prison under twelve years of age have decreased from 61 in 1841 to 15 in 1858." Having further adverted to the good done by the Ragged Schools, and quoted from the paper read by Miss Carpenter at the Bradford meeting of Social Science, to show their beneficial effect on society at large, Sir John Pakington said he had endeavoured as far as possible to state the grievance which had necessitated their Conference, and he trusted that the result of their discussion that day would be a practical remedy for it. The remedy he proposed was to address a firm remonstrance to the House of Commons, and to demand that the dictates of benevolence and common sense should be no longer disregarded; and he trusted that they would be supported strenuously, both in and out of Parliament. Having shown how, when last brought on, the question had been met on both sides of the House in no party spirit, the hon. chairman expressed a hope that such would be the case this year, and while advising that it should be brought on early in the session, as a substantive motion, instead of being left till the estimates were brought in at the end of the session, in the presence of only a few members, he suggested to the meeting the propriety of choosing for their leader not himself, but some other of his colleagues, because he was afraid the fact of his being a member of the late Government would not do their cause any good. ("No, no.") The hon. baronet, after some further general remarks, expressed his confidence in the ultimate success of the movement.

Mr. Recorder Hill, who was warmly received, rose to move the first resolution. He said: I have listened, as I am sure you have, with great pleasure to the admirable address of the right hon. baronet but with one exception, and one only. I did hear, with something like dismay, that he desired to resign his post of our champion in the House of Commons to some other member of that assembly. (Hear.) There are members present who do me the honour to call me their friend, and I appeal to them whether our cause would not suffer very greatly from such a delegation. (Applause.) In respect to the question before us, it is one I have pondered much, if not very wisely, upon; and feeling that we are met here upon admitted principles, intending to do our best to carry these principles into action, I have thought it my duty to commit to writing and to read what I have to offer upon this subject. That the welfare of society demands the education of all its members, high and low, is a doctrine without opponents; and moreover its truth is attested by an array of names in the paper lying before you which would go as far as authority can reach to establish the principle against the utmost strength of opposition. If, in any minds doubts may yet linger as to the blessings of universal education, they will be found on examination to resolve themselves into objections against particular branches of instruction, considered in reference to their utility to certain classes of pupils. Seven-and-twenty years ago, when the doctrine which I have just stated was only militant, and not yet triumphant, I heard in the House of Commons William Cobbett oppose general education, on the ground that he would rather a peasant could make a good hurdle than be able to construe a Greek tragedy. He was conclusively answered by Lord Althorp. "So would I," said the Minister, "because a peasant who has learnt to make a good hurdle is a better educated *peasant* than one who has only learnt Greek." (Hear.) In all undertakings in which I have engaged I have ever kept before me this happy and most suggestive remark. The object which has called us together to-day is to do our best towards bringing the little outcasts of society into the brotherhood of mankind, and enabling them to hold their new position by conferring upon them so far as instruction and training at school may avail, the faculty of self-maintenance in both its great branches, that is to say, the power of earning a livelihood for themselves, and the power of self-government to protect them against the manifold temptations to evil by which they are sure to be attacked. If, then, by virtue of a small present outlay, we succeed, their industrious neighbours will be spared the onerous task of providing for their subsistence, and the community at large the injuries, the losses, and the heavy pecuniary burdens which these poor children will entail on their country should they fall into crime—the too frequent consequence of an outcast life. Such being our object, we are prepared to admit that whatever branches of instruction are likely to redound more immediately to the advantage of the individual than to the interests of society, lie beyond our scope. That the grand truths and commandments of religion should stand first in any system of education for every class will not be denied. (Hear, hear.) That the moral duties call for unremitting attention on the part of the teacher, will be at once admitted; and moreover, that it is impossible too earnestly to promote the moral and mental acquirements peculiarly

Digitized by Google

adapted to the wants of our class of pupils, namely—honesty, intelligent and persevering industry, self-control, and self-respect. Specific branches of secular instruction must, I submit, be chosen strictly with a view to the great end of making the pupil a good citizen, acting well his part in the rank of life in which he was born. If the result of this training should enable him to advance his position, it will still remain true that such is not the mark aimed at, but an incident which we neither go out of our way to seek, nor do we grieve over it when found. Knowing that such a consequence in individual instances (and none other can be reasonably expected) while it will not disturb the order of society must operate as a useful stimulus to youths who start with vantage ground in the race of life, urging them not to suffer themselves to be outrun; yet, as whatever may be the effect on its worldly fortunes, sound education must always be more precious to the immortal child than to the mortal state of which it is a member, the primary duty to bestow this blessing on his little ones rests on the immediate author of their being; and therefore wherever the parent is both able and willing to perform this duty, the tutelage of the State becomes unnecessary, and consequently undesirable. So far I shall probably meet with no dissent, but as regards what is to be done where the parent *can* perform his duty in whole or in part, but *will* not, grave differences of opinion exist. (Hear.) If you allow the repudiating parent, it is alleged, to throw the burden which he is capable of bearing himself on the shoulders of the public (heavily loaded as they are), the State is unjustly taxed. To which my answer is, if it is better for the State to bear that burden than to suffer any of its members to grow up in ignorance, and so in the end to afflict it with the far heavier burdens of pauperism and crime, then, unless the State has both the power and the will to enforce the performance of his duty on the recalcitrant parent, it will do wisely to prefer the lighter burden to the heavier. First, then, as to compelling the parent by force of law to educate his child, either by himself or by paying for its education by others. Is it not enough to say of this imagined project that such a stretch of legal authority has never yet been attempted in any age or country? And may we not very safely promise to withdraw our claim for education at the public cost of all children whose parents can but will not furnish the requisite means whenever such a law shall have passed our Legislature? But, to treat the objectors with fairness, it must be admitted that they have never dreamt of such an enactment. What they rely upon is the natural consequence on the competent parent of withholding that assistance from public sources which he himself does not supply. But what is that consequence? It is that his child grows up in ignorance, and encounters its disqualifications and its perils. But that is a consequence which the very line of conduct adopted by him proves he is willing enough that his child should encounter. Doubtless, if he himself were the only party to suffer, he might be left to the results of his own choice. Perhaps, also, we might be forced to admit (however reluctantly) that, if he and his child were the only parties to be considered, the child must in that instance, as in so many others, be left to bear as he best may the bitter calamities which spring from evil parentage. But if it remain true that the interests of the third party—the community into which the child is born—will suffer or gain as the child is brought up in ignorance or becomes the recipient of good instruction and Christian training; and if the loss on the one hand, or the gain on the other, far outweighs the outlay which is to determine the lot of the poor child; are we, the public, to spite ourselves because, if the parent did his duty, we should obtain the advantage without paying its price? The objectors argue loosely from admitted facts. The parent furnishes his child with shelter, food, and clothing, and so far identifies himself with his offspring. But many a parent who will strain hard to supply physical wants, for which his sympathies are quick and easily roused, will not forego the slightest gratification to supply the want of education for his child, because that is a want which he cannot realise to his own perceptions; so that, to argue from the parent's willingness to supply wants which he *does* recognise, that he may be *made* willing to supply those which he does *not* recognise, is but fallacious reasoning. (Hear.) In truth, what jurists would call the solidarity of parent and child, is pushed by the objectors farther than the law of nature (which, nevertheless, is the only law they would invoke) is able to vindicate the relation. But the principle for which we contend, viz., that of State provision for educating children whose parents neglect that duty, is practically admitted in our legislation as respects various classes; and consistency, in addition to more potent reasons, requires it should be extended to that of which we are the advocates. It is already applied to children in gaols, to the extent of relieving the parent, whatever may be his wealth, not only from the burden of their education but from that of their subsistence, whereby, as I confidently submit, the principle on which I am relying is in practice exaggerated until it becomes an abuse. (Hear.) In all Reformatory Schools the principle is exemplified well nigh in its purity. Here the parent is not relieved of his whole burden; but, up to a certain limit, he pays for his child a sum adjusted in proportion to his ability. But why should there be any limit fixed on behalf of the competent parent short of the total cost of the child, in the boarding school to which (in lieu of a prison) he is consigned by the benignity of the law? (Applause.) In poor-houses, however, the principle may be seen in its perfect exemplication, not being unduly qualified on the one side or on the other. For the pauper (though perhaps by his own default) having no means of self-maintenance, the burden of his keep, and also his child's keep and education, falls necessarily upon the State, and the whole burden is at once accepted. National and British Schools furnish another exemplification of our principle. In these a portion of the cost of teaching is defrayed by the parent: but, as no attempt is made to measure the parent's contribution by his ability to contribute, and, as in point of fact the generality of parents who avail themselves of these schools could well afford to make larger payments than are called for, it appears to me that the limit is adjusted rather by the danger of rising above the parent's willingness to pay, than from any fear of over-taxing his ability. Our class, as you will have observed, stands between that wherein the children are educated partly at the cost of the parent and partly at the cost of the public, and the pauper class which obtains both education and maintenance from a public source. And, now, I am in a condition to ask upon what ground is this particular class to be deprived of State help, or why is that State help to be reduced to a paltry dole—contemptible to offer—humiliating to receive? (Applause.) I am about to prove that if any difference ought to be made, the grant for the education of this class should be more liberal than for any other—not merely in proportion to its numbers, but in relation to each individual pupil. In schools to which the parents contribute they also afford invaluable assistance in securing the punctual attendance of the pupil, and by their influence over their child they strengthen in all ways the hands of the teacher; while our class of children is left to its own self-government—rather should I say to its own self-anarchy. Indeed, when the parent does interpose it is seldom in co-operation with the teacher—at all events in the earlier stages. On the contrary, it is to throw impediments in the way of the child's regular attendance, and of its submission to the teacher's governance. Want of clothing, which in many instances, the parent might readily supply, the slightest interference with his (the parent's) own gratification, or the false indulgence of his child during his fits of capricious fondness, his passionate resentment of necessary discipline when his child falls under it; all these, and many more causes, often arise to make the very existence of the parent a serious hindrance to the education of his child. Hence the influence of the teacher must be exerted to furnish not only the motives to good conduct and to diligence in the hours of instruction, but must be potent enough, overcoming all obstacles to bring the freedom-loving child from day to day to submit itself to the restraints of a school. And hence again arises a necessity for domiciliary visits to the parent to remove these impediments, whenever possible; in short, to educate the father and the mother until they become co-operators in the arduous task of educating their untaught, ill-trained, and misgoverned child. (Hear, hear). In the school to which I am more particularly attached the experience of every year convinces me that such visits are, if not absolutely essential, at least a most important feature in the good management of Ragged Schools. But this addition to their labours not only demands that the numbers of Ragged School teachers should be much larger in proportion to the numbers of their pupils than in schools attended by children of a better class, but it will be seen at once that

as so much depends on the personal influence of teacher upon pupil, the teacher must be endowed with gifts which, although more widely diffused by Providence than I had ever ventured to hope for, are, nevertheless, sparingly vouchsafed, and, like other rare talents, require to be remunerated accordingly. On the other hand, the employment of pupil teachers, however much to be desired, has been found by experience to be here impracticable, for reasons easily divined, but which time does not permit me to even enumerate. I now pass on to the objections to which we have been obnoxious; one of which it will be remembered, I have incidentally disposed of. First, then, we have been gravely informed that we are pleading the cause of a body which has no existence. Your children, we are told, are either the offspring of paupers—and therefore paupers themselves—and in that case must be educated by the Guardians of the Poor, or they are criminal children who ought to be brought within the grasp of the law; when for greater offences they will be consigned to the Reformatory, while for lesser infractions they will be sent to the Industrial Feeding School. I waive the objection that Industrial Schools are as yet but few, and that it is but seldom we find magistrates willing to enforce the somewhat perplexing statutes which give them compulsory powers. Again, I waive all objection arising out of the difficulties which lie in the way of procuring (through the Guardians of the Poor) an efficient education for pauper children—meaning by efficient education one that lays the axe at the root of hereditary pauperism. For I stand on the position that our children are neither paupers nor criminals, although the ground which they occupy is conterminous with that of both those classes, and the line of demarcation is not seldom evanescent. The physical wants of our children are supplied from the natural sources—often ill-supplied, no doubt—yet not so ill but that the managers of Ragged Schools are willing to supplement, as occasion may arise, any deficiency, so far as is requisite to prevent the pupil from being disqualified by hunger from engaging in the business of the school. And as regards this expense they do not seek assistance from the Government. These children are therefore not paupers, nor have they been convicted of the slightest breach of the law. Consequently they are not criminals, and therefore they cannot be sent by compulsion either to the Reformatory or to the Industrial Feeding School. (Hear, hear.) May not, I would then ask, such a classification as that for which objectors contend, do something towards driving both the child and its parents into the ranks of the pauper or the criminal population? But why occupy time in proof of the notorious fact that not only the class *does* exist, but that it has swollen into vast numbers. The immense multiplication of Ragged Schools throughout England is either conclusive demonstration of its existence and its large numbers, and also of its wants, or this multiplication of schools is a gross abuse. Yet if it be an abuse it is one of a most incomprehensible description, since it is no abuse of public money but of private beneficence and private labours pressing severely on the benevolent undertakers. But if there be abuse, these undertakers must themselves be the abusers of their own charity? I shall not pursue this topic further. If no other evidence could be found (and there is abundance), the testimony of Lord Palmerston and Lord Derby, the heads of the two great political parties into which the nation is divided, is conclusive not only to prove that a very large class such as I have described is spread throughout the land, but that Ragged Schools have performed the duty of educating it with signal advantage to the community. Another objection of which I have but lately become apprised, issues from a high and respected quarter. The pedigree, however, of this objection is its only merit. An express admission has been made, where I am under the impression the fact had theretofore been contested, that our class has a real and substantial existence, but on the other hand, with this admission is coupled the surprising fact that it already receives a sufficient share of the grants. *Still* receives; I ought to have said, as in 1856, its treatment was far better than it is now. That our present reduced share is exceedingly small, not to say microscopic, cannot be denied. In what sense, then, is it sufficient? No one pretends that it makes the most distant approach to the share allotted to the National and British Schools. For while the proportion in our schools which grants bear to private contributions is as one to four, or even five, the proportion in National and British Schools is as four or five to one. I advisedly understate the real proportion when I say that the higher class of schools receives sixteen times as much of Government aid, when that aid is compared with their receipts from their private subscriptions, as our schools do on a similar comparison with our private resources. I have hurried over the two last topics, namely, the characteristics of our class, and the wretched exiguity of the aid afforded, because I desire to leave their full exposition to our valued friend, Miss Carpenter, who does not, as I can only do, make occasional visits to outcast children, but passes her life in the midst of them, dividing her long and arduous day among the asylums founded and sustained by her generous donations, by her unwearied assiduity, and by the influence of her example on her admiring friends—(applause)—giving some of her hours to her Reformatory, some to her Industrial Feeding School, and many indeed to the Ragged School of St. James's Back, situated in one of the most unwholesome and repulsive quarters of Bristol—a city rich in such districts, yet not, perhaps, much richer than her neighbour. I now arrive at the crowning objection. We cannot give the requisite guarantees, we are told. Ragged Schools, it is said, are not denominational institutions attached either to a church or a dissenting congregation. What, then, is the safeguard that religion shall have its due prominence? The answer is manifold. The first is, that we are not entering upon a new speculation. Ragged Schools have been established long enough to possess a history. Have they been, are they now, does any man, woman, or child sincerely believe they ever will be, irreligious? Is not the religious teaching of Ragged Schools their leading characteristic? Is it not so of Reformatories, and of Industrial Feeding Schools, so far as these have come into existence? And yet none of them are denominational. I am not cognisant of a single exception to the religious character of these institutions, but, should an exception be found, repudiate that school. Withdraw your grant. Nay, but such a step would be unnecessary. The private contributions which form its claim to the grant would drop off as the fact became known. The school would die out of itself. I am an old man. The education of the people has occupied my thoughts from my youth; and I avow my belief that, except in a few instances so few as to be insignificant, it will be found that no motive but strong deep-seated religious sentiment will ever supply the zeal and the perseverance essential to the successful conduct of a Ragged School. The eye of faith beads its gaze on the immortal spark shining through all that is revolting in the squalid little creatures, whose neglected state appeals with irresistible force to the benevolence of the Christian philanthropist. Dirt and rags are no longer heeded. Even the stolid aspect, the lowering, suspicious, and sullen brow—even these most disheartening features are looked upon only with pity by him—*her*, I ought to say, who does her ministering under the unwavering conviction that the poor human frame over which she yearns is the seat of an undying soul! Hence no obstacle is deemed too great, no chance of redemption too small, to justify unceasing efforts in behalf of these little ones. Therefore do I say, Ragged Schools will ever be religious institutions, or they will cease to be at all! From the spiritual we are sent to the grossly material—from religion our objectors drop down to cash. (Laughter). What guarantee can we offer that the public money which we seek to handle we shall justly expend? Before I answer this question I proffer an admission, which is, that although in theory, as I submit, I have proved the whole cost of educating this class ought to fall upon the State, yet we do not seek to stretch that principle to its extreme length in practice. Doubtless a guarantee is necessary, and we can imagine none better than that which has been hitherto demanded and accepted as sufficient, and to which we are perfectly willing to conform, namely, that whoever asks for the public money to expend on a future object must, as a test of his sincerity and his earnestness, contribute his own money to the furtherance of that object, and not only his money, but his time and labour. (Hear, hear.) For ourselves, we ask only that the public grant should equal our private contributions, adding our labour, whatever that may be worth, to the amount subscribed. Let me incidentally remark, that we will not here enter into any inquiry as to whether the grants shall be drawn from the general taxation of the country or from local rates. Grave and important as the question is, it does not fall within the

Digitized by Google

scope of this Conference. Should it require to be entertained outside the walls of Parliament, let it be discussed on some other occasion than the present. We have enough to do without straying beyond the limits which have been assigned for our deliberations. It cannot be denied, and ought not to be concealed, that when grants are made in proportion to private contributions, some districts will remain without provision. We are aware of this defect. It has always existed. No remedy has hitherto been discovered, and we are not prepared to suggest one ourselves. The Legislature and the Government have justly determined that, notwithstanding the principle of State subsidies cannot be carried into effect with systematic perfection, a sufficient amount of good is attainable to justify its application as long as it can be accompanied with a reasonable guarantee. I believe we only ask the Government to be consistent with itself. That not having delayed their subsidy to other classes until a perfect system could be devised, they shall not for such a reason withhold it from us. And here let me add that if our means were as ample as our desires, we would not apply to the Treasury at all. We have taken up a burden fully commensurate with our strength. That burden with God's help we will still carry. But taxed to the full extent of our ability, we desire to do yet more; for indeed much more remains to be done. Whether or not we fulfil our self-imposed duties may surely be ascertained by the corps of inspectors appointed not by ourselves but by her Majesty's Government. True it is I have heard aspersions cast on that exemplary body of men, but thrown out I hope and trust only in the heat of debate, and not meant to be renewed in cooler moments. The inspectors are scholars, gentlemen, and Christians. (Applause). Some among them are ministers of the Gospel. They exercise their duties under the public eye. Instances may, perhaps, occur of unfaithfulness to their trust. If such have occurred, sure I am that they must be few indeed, for to the public they are unknown. But can any ground be stated, or even surmised, for a general distrust in these officers which would not apply to every functionary in the State, from the highest to the lowest? We can picture to ourselves the fatal consequences of giving way to a general distrust of every class of public servants. Its end would be anarchy. I have often asked myself how it is to be explained that the cry of danger as to abuse should fix upon Ragged Schools as the subject of its panic. We are all but too conscious that whenever the physical necessaries of life are dispensed from a public fund the peril of abuse becomes imminent, and that such dispensation should be most watchfully conducted. But why? Because none are so ignorant as not keenly to appreciate the value of food, clothing, shelter, and warmth, which, unhappily, thousands of the ill-trained among our countrymen eagerly desire to command without industry or thrift; and hence the pressure upon all who have power over donations of this nature. Alas, in the class of which I am speaking, there is no such affidavit for instruction, either for themselves or their offspring. They must be wooed and courted to the reception of our gift. The larger half of our toil is expended in persuading the more immediate objects of our bounty—the children, that we are pressing a boon upon them and not exacting a penalty. Surely, then, it is natural I should marvel at the consternation which has seized upon the minds of gentlemen high in power and influence, when they hear of grants to Ragged Schools, combined, as such consternation is, with perfect equanimity of mind in respect to grants, which are very much expended in providing for these physical wants which provoke, as it were, abuse. (Hear, hear). But whatever the risk, great or small, it must be encountered, because neither the education of the ignorant juvenile poor, nor the reformation of the juvenile criminal, can be achieved without evoking the great voluntary principle of action—the glory of our country! I envy him, whoever he was, who struck out nearly thirty years ago, the plan by which a union has been consummated between the financial power of the State and the benevolent efforts of private individuals. That union is not without its imperfections, and probably imperfection will always attach to it. Yet is it a noble invention in the science of government, and our purpose to-day is that so far as in us lies, we may obtain it in full measure for that class of our fellow-subjects which most requires its fostering aid. (Applause). Having concluded his able paper, the Recorder added: In some particulars there is a slight difference between myself and our right hon. chairman, but it is only the result of a certain discrepancy in our minds, for I have to plead guilty to what the hon. chairman is certainly free from—to some timidity of character. For that reason I do not perhaps go quite so far as I otherwise should do in one or two particulars; but that is all. I will conclude by reading the resolution put into my hands, and which I have great pleasure in moving:—"That obedience to the laws of God and man is powerfully promoted by the diffusion of sound knowledge and the training up of the young in the exercise of the great duties of life; therefore it is incumbent upon the State to ensure education for all children for whom their parents are through poverty unable, or through ignorance unwilling, to provide it."

The resolution was seconded by Mr. Scholefield, M.P.

Miss Carpenter then read a paper which stated the peculiar and delicate nature of the work which Ragged Schools had to do; showing that while the absence of denominational or party help to the funds necessary for the support of such schools made a Government grant more necessary for them than for any of the better supported schools now receiving State aid, the children attending them were not in a condition to benefit by any influence but that force of Christian charity which actuates a voluntary teacher. The State could not educate such children, it could only help the efforts of those who were trying to do so. All that was asked for was that grants should be made in proportion to contributions, as in the case of other schools.

Miss Carpenter's paper was received with marked applause, and followed by a vote of thanks, proposed by Sir John Pakington, and unanimously carried. The Right Hon. Chairman then invited further discussion on Mr. Recorder Hill's motion.

Some consequent debate as to whether the terms of the resolution involved a statement that it was the duty of the Legislature to provide education for the children of parents who were unwilling as well of those who were unable to provide it for themselves, ended in Sir John Pakington remarking that as unanimity was desirable, he should slightly alter a portion of it, so that it should read, "It is incumbent upon the State, as far as possible, to ensure the means of education to all children."

In this modified form the resolution was carried unanimously.

The Rev. Dr. Guthrie, of Edinburgh, in moving the second resolution,—"That neglected and morally destitute children constitute a very large class of the community, yet that no educational aid is given for their education from the Parliamentary grant comparable to such as is given to such classes of schools as already receive Government assistance,"—bore testimony to the necessity existing for some schools suited to neglected and destitute children in every large town. Dr. Guthrie also proved the actual results which such schools had produced in Edinburgh alone. Returns from the Governor of Edinburgh gaol showed, he said, that Leith supplied four times as many juvenile delinquents as Edinburgh did, there being no Ragged Schools in Leith; while in Edinburgh these schools had cleared the streets of all juvenile beggars, and reduced the commitments to the gaol to "half a juvenile" per cent. Before the establishment of the schools, the commitments of prisoners under fourteen years of age were 5 per cent. In conclusion, Dr. Guthrie said, that he did not ask for more than was privately raised, nor even for so much, but only for one-third of that amount; and the best security for the proper expenditure of the amount granted would be the fact that for every 10s. put down by Government they would have to put down 20s., and whatever they might do in England, in Scotland they understood what to do with money better than to throw away 20s. to get 10s.

The speech was loudly cheered.

The motion was seconded by the Earl of Shrewsbury and Talbot, and after some discussion carried unanimously.

The Rev. Dr. Miller said he had to move:—"That the experience of the last eighteen years has proved that this portion of the population is reached in many districts to a considerable extent, and can be effectually raised by Ragged and Industrial Schools; but that schools of this class, which, to be good, involve much greater expenditure than ordinary schools, cannot be permanently supported in the required efficiency, or extended to all the districts requiring them by voluntary aid alone." To the terms upon which Government aid should be asked Dr. Miller drew the attention of the meeting. The rule of the Council was that inspection should accompany aid, and so far as Dr. Miller had seen of Government Inspectors, they performed

Digitized by Google

their duties admirably. But if Ragged Schools were to be viewed and treated under inspection as Parochial Schools might be, harm would be done, especially if it demanded that certificated masters and mistresses only should be employed. After some further observations from the Rev. Prebendary Burgess, Dr. Ball, and others, the resolution, which was seconded by Lord Ingestre, was carried.

Lord Lyttelton then moved:—"That it is the duty of the State to give liberal financial aid to such schools, availing itself, as in the case of Reformatories, of that voluntary effort which is an essential condition of success." In doing so, he expressed his entire concurrence in the two general principles therein enunciated.

Mr. Spooner, M.P., briefly seconded the resolution, expressing his entire approval of the objects of the Conference, and promising Sir John Pakington his cordial support in enforcing their views in the House of Commons.

Mr. Hanbury, M.P., then moved the appointment of a committee, consisting of nearly all the leading noblemen and gentlemen present, with power to add to their number, for the purpose of promoting the objects of the Conference by all such means as they might approve, and in particular by earnest applications to her Majesty's Government and Parliament.

The resolution was seconded by Mr. Baker, and carried unanimously.

Sir John Pakington then left the chair, and on its being taken by the Earl of Shrewsbury, a cordial vote of thanks, moved by Mr. Recorder Hill, and seconded by Mr. Kynnersley, was passed to the right hon. baronet for his presiding on that occasion. Sir John briefly acknowledged the compliment, and the meeting separated.

ST. BARTHOLOMEW'S HOSPITAL.

Tuesday, Jan. 8, at twelve o'clock, a special meeting of the governors of this famous medical school was convened in the great hall of the hospital, for the election of a president of the institution, in the room of Alderman Sir George Carroll, recently deceased, who had held the office for about six years. There was a very large muster of the governing body, including, among many others, Alderman Salomons, M.P., Alderman Sir John Musgrove, Sir James Tyler, Alderman Rose, Alderman Phillips, Alderman Gabriel, Mr. Dakin, alderman elect, Mr. Anderton, a member of the Common Council, Mr. Gilpin, treasurer of Christ's Hospital, Mr. John Morley, Mr. Daniel Britten, Mr. Serjeant Payne, Mr. Kinnersley Hooper, Mr. John Jones, Mr. Money-Wigram, jun., Mr. Charles Hill, Mr. Ewell, Mr. Wadeson, Mr. Rivington, and Mr. John Wood. Recently the House Committee of the hospital, by a unanimous vote, recommended the Lord Mayor as a fit and proper person to fill the vacant office of President, and at the meeting of the governors, on the motion of Mr. Gilpin, treasurer of Christ's Hospital, seconded by Mr. Bentley, High Sheriff of Hertfordshire, that recommendation was adopted without a dissentient voice. Immediately afterwards the Lord Mayor was invited to attend the Court, and on being presented to them was greeted by every mark of respect. Mr. Forster White, the treasurer of the hospital, who presided as chairman on the occasion, addressing his Lordship, said the governors, in the exercise of their undoubted right to select whom they thought proper to the various offices connected with the institution, had unanimously elected him to the distinguished position of President. He congratulated him on attaining to that position, feeling well assured that his Lordship would derive satisfaction from the performance of the duties of the office, inasmuch as every act in which he would take part in that capacity would tend to ameliorate the sad condition of the sick and suffering poor, and to encourage the cultivation of pure medical science. Turning to the governors, he congratulated them on the selection they had made, because, although they were all proud to see their new president occupying the dignified position of Lord Mayor, still it was not in that capacity that they had invited him to accept the office, but in consideration of the public respect in which he was so justly held, from his integrity, his estimable private character, and the public services he had rendered as an able and upright magistrate, and as a member of Parliament and of the Court of Common Council. The Lord Mayor, in turn, while thinking Mr. White, the treasurer, had greatly overrated him, expressed the gratification he felt on being spontaneously and unanimously elected to the office of president of the hospital. He regarded it as an honour to be connected with so important and useful an institution, mitigating as it did from time to time so much of human suffering among the poor, and the beneficial influence of which as a great school of medicine and surgery was felt more or less all over the world. Those attributes were to some extent common to all the metropolitan hospitals, but perhaps to none in the same degree as to that of St. Bartholomew. He would endeavour, as far as he was able, to make himself useful. The details of the institution were regularly worked out by a staff of suitable officers and by committees, acting under the supervision of the governors and the treasurer, and occasionally of the president. If, however, at any time any matter of detail should arise on which the governors thought his assistance might be of use, he would endeavour on all occasions to render it in working out the details of the hospital, or in any other way. The response of the Lord Mayor was followed by some cheering, and with that the ceremony terminated; but before the members of the Court separated, they passed a unanimous vote of condolence to Lady Carroll on the death of her husband.

HOSPITAL FOR DISEASES OF THE CHEST, VICTORIA PARK.

The annual general court of the governors of this institution was held on January 8, at the London Tavern, under the presidency of the Right Hon. the Lord Mayor, M.P. The minutes of the last general court having been read and confirmed, Mr. R. P. Slater, the secretary, read the report, which stated that during the past year 363 patients have been received into the wards, making, with 62 under treatment at the commencement of the year, a total of 425, of whom there now remain in the hospital 57. Of the cases discharged 341 have received more or less material relief, and 27 have died. The average number of in-patients resident throughout the year has been 48; the total number admitted since the opening of the wards in 1855 has been 1,604. The number of out-patients admitted to the benefits of the institution during the year has amounted to 7,725, making, with 54,693 previously admitted, a total of 62,418 who have received relief from the institution since its establishment in 1848. The average weekly attendance during the year has been 861. The financial statement showed that at the commencement of 1860 there was a balance against the hospital of 210*l.* 0s. 3d.; the total receipts for the year ending 1860 amounted to 4,258*l.* 14s. 8d.; and the expenditure for the same period to 5,237*l.* 16s. 1d.; leaving a deficiency of 1,189*l.* 1s. 8d. This, however, has been met by a loan of 1,500*l.* from the bankers, so that there remained on the 31st ult. a balance in hand of 310*l.* 18s. 4d. During the past year a chaplain to the hospital has been appointed, and Divine service, at which the patients attend, is performed twice a-week in the chapel. The report was unanimously adopted, the officers for the year ensuing appointed, and votes of thanks having been passed to the gentlemen who had filled the various offices in connection with the institution during the past year, and to the Lord Mayor for presiding, the proceedings terminated.

THE ASYLUM FOR IDIOTS, EARLSWOOD.

The annual entertainment to the inmates of the above institution took place on Monday evening, January 7th; many of the directors and their friends being present. At five o'clock the children, both male and female, partook of coffee, tea, bread and butter, and cake. At half-past six the principal amusement of the evening commenced. This consisted of an acted charade, written for the occasion by the superintendent, Dr. Down, and illustrated and performed by the staff at Earlswood, several of the patients taking a part. It was composed of four scenes. The society has become a large one, but the demands made upon it are greater than its means. There are upwards of 320 inmates, part of whom are paid for by friends, and the rest elected for life, or for a term, as the case may be. The Board, anxious to meet the wishes of a large number of the subscribers, determined last year to admit some of the cases for life, and ten have already been received. Of course, this step entails increased responsibilities upon them.

INDUSTRIAL FEEDING SCHOOLS.

If our readers perused with that care and attention to which it was entitled the letter of Mr. Alex. Thomson of Banchory, in our initial number of 1861, they made themselves acquainted with one of the most important documents which has ever appeared in this journal. So high is our estimate of the system there so ably expounded that we venture to express a hope that the Aberdeen Industrial Feeding Schools will form the model for many institutions of a like character. There are, of course, those who will raise objections to some of the details of its management. It will be said, for instance, and above all, that the scheme is too comprehensive—that too much is done for the children, and so their natural incapacities are there rather encouraged than ameliorated. And if it could be demonstrated that this was true, it would be a fatal blow to this *beau ideal* (as it appears to us) of philanthropic usefulness. But while the comprehensiveness is admitted it may be asked whether a system which developes the physical and moral endowments of the young is not best calculated to prepare them for the struggles incidental to their future career.

A very imperfect acquaintance with the homes and domestic habits and social condition of the lower orders may supply an observant person with evidence of the necessity of the all-but complete removal of childhood from parental contact. And this necessity is rendered more urgent by a consideration of the exacting requirements of this high-pressure age, which so grind down the vital energies of the labourer and artizan as to preclude the possibility of adult improvement. We are disposed to think that in all questions of this kind a sufficient prominence is not given to that *material* element which plays so large a part in determining the realities with which we are here called upon to deal. We do not measure, as we should do, the iron despotism of its unbending laws. For instance, let us take the adult generation of which we are ourselves a part, and inquire what are the chances of our transmitting, unaided by such help as that we are now discussing, to our immediate successors the psycho-physiological predispositions which have been partly our own heritage, and partly our own inevitable acquirement. We speak, of course, of that class from which are drawn the juvenile population of our Industrial Schools. A mechanic or labourer is in possession of a weekly income, of precarious tenure, on which he can just manage to keep body and soul together. To say that he is endowed with anything but the merest animal instincts would be to make a purely gratuitous affirmation, unwarranted by experience and unsustained by facts. Of course these animal instincts must be gratified, in obedience to an irresistible physiological law, and the wages which have hitherto supported *one*, are, it may be with a slight additional help from the weaker vessel, accommodated to the maintenance of two. In a word, our friend is married to one not less fatally gifted than himself with manifold predispositions to evil, alike physical and moral. It is a brief story afterwards—that little multiplication of sinful humanities, stamped with the worst features of either parent, and reared in the starving den of poverty. The recent exposures of some of the incidents peculiar to the overcrowding of wretched hovels are but a faithful picture of realities which obtain in almost every town or county in this great kingdom. Here is an arena for the display of the benevolence of the modern philanthropist, and for the elaboration of social science. If something be not done these children become fiends, and live to beget a fiendish posterity. There is no escape from such a sequence but by a complete alteration in all the social surroundings of our juvenile population. We do not say that the fault of all this evil lies with the parents. Far from it. For we do not affirm that with their trials and temptations and predispositions we might not ourselves have acted as they have done. But the facts being so, the impossibility of obeying the fifth Commandment of the decalogue, upon the due observance of which Mr. Alexander Thomson dwells so forcibly, is as clear as anything can be. Honour to whom honour is due. Is honour due to those who cannot honour themselves, and whose whole physical and moral life is a progressive deterioration? The mere tie of blood is a material tie, and cannot ensure the moral observance of the Mosaic precept. "We are, therefore, shut up to the necessity of stepping in betwixt the parents and the children, and taking upon ourselves the discharge of a certain portion of the duties of the parents." Then comes the important question—how far are we to go? What is to be the limit of our adoption of parental responsibility? At what point are we to cease to do that which has been forced upon us by the ordinary evils of our modern social state? If we do too much it is obvious that we not only encourage the neglect of children by their parents, and so create the necessity for increasing labour, but likewise unfit those children for the realities they will be called upon to face the moment they leave our temporary shelter. If we do too little, the cost of the elaborate machinery by which even that little is effected is thrown away, and we might almost better do nothing; for our unsatisfactory results are certain to clog the development of future charity. It seems to us, of a truth, that the exact measure of requirement has been attained by those schools of whose principle and practice Mr. Alexander Thomson is the able exponent. The *material* element which enters so largely into his system is the substratum upon which to build up moral and intellectual structures. Half the failures in our scholastic system arise solely from the neglect of this consideration. We cannot instruct the hungry, and put thought, high and holy, into starving bodies "Depend upon it (said Sydney Smith) the wretchedness of human life is only to be encountered upon the basis of meat and wine." This saying is not meant for mere witticism or a satire. It is (substituting *food* for "meat and wine,") the exact expression of a physiological verity. Every—the very feeblest—thought demands for its entertainment, that is in its conception, some expenditure of material force. The minute fibrils of nervous

Digitized by Google

tissue must yield up their elements before any intellectual process can be entered upon or constructed. Is this "materialistic?" It matters not: it is true; and it comes from God. If, therefore, the nervous tissue is not nourished in due proportion to the exhaustive call which is made upon it, it is useless to expect any response to an educational appeal, which does not as much look after the physical as the moral structure. There can be no guarantee of improvement if we do not make this felicitous combination. We like the term *Industrial Feeding Schools*. It is so comprehensive, and implies so much.

We put these children, then, in the best possible position to fear God, honour the king, those to whom they owe so much, and themselves. They are fed, and clothed, and *trained*. They are not removed altogether from their own homes, but are permitted to retain that tie which may at once teach them their own advantages in daily culture, remove them from domestic struggles, and enable them by a growing rectitude of conduct to exercise some influence upon parental degradation. If they fail in after life, it is not by reason but in spite of the much which was done for them. This return to the parent roof is a very important feature in the Aberdeen schools. For there is too much reason to suppose that where childhood is permitted entirely to lose sight of those to whom it owes the condition of its birth, and therefore in some sense the duty of its obedience, a social relationship is initiated which it is desirable, as far as possible, to discountenance. Nor are we sure that the complete isolation of children from their parents, and their almost claustral seclusion in huge buildings, and in multitudinous companionship, is not fraught with mischief of no ordinary kind. The experience of many, indeed, is to the effect that children drawn from such sources as these are very useless and unavailable.

We do not dwell upon the general details which Mr. Alex. Thomson so ably lays before us. They are all admirable. Plainness of structure, economy of management, limitation of numbers, cleanliness of habits, nutritiousness and simplicity of diet, usefulness of information imparted, inculcation of industrial habits, bearing as far as may be upon the question of future remuneration, together with the exercise of considerate kindness by all in authority—these are all that they should be. We have but one suggestion to make, and that is, that there should be an extra hour for play, which is little less than second life to childhood. From four to seven (a drowsy period) is a long time for continuous mental labour. It does not do to exhaust the reluctant intellectual development of the young by too sustained an expenditure of cerebral force. And we think that by the adoption of this suggestion there would be a better chance of carrying out effectually the great desideratum of every educational system—the "imparting to pupils the power and the desire to add to their knowledge as long as they live." This is the true end and object of all teaching.

Such is the large and beneficient scheme advocated by Mr. Thomson, of Banchory. It is, indeed, in our humble opinion, all that it should be, and the only substitution we can supply to the neglected little ones everywhere around us for the loss of "*the family*, with all its duties, its privileges, and its endearments." Happy are the children who are in such a case, happy are they who can find their educational home under the shelter of institutions similar to the Aberdeen Industrial Feeding Schools.

THE BIRMINGHAM CONFERENCE.

THE very successful meeting of the Educational Conference held on Wednesday morning, January 23rd—of which an account will be found in another part of our columns—was followed by a more than equally successful evening gathering in the Town Hall of Birmingham.

"Business first, and pleasure afterwards." The business of the morning had been so satisfactorily transacted as to predispose all the transactors to congratulate themselves and each other; and had they been less inclined to do so, Dr. Guthrie's address would, it seems, have spread among them a compelling spell of congeniality and enjoyment.

Though the business accomplished in the morning was but the uttering of words and passing of resolutions, yet when those words and resolutions express the determination of a number of influential British subjects that a certain course ought to be adopted by the Legislature, sooner or later that course *will* be adopted. The wrongs of the Ragged Schools will be righted, and the Educational grant will be given,—in time. This was the morning's work, and we think that the facts stated in the evening's speeches afford good hope that Ragged Schools are in no danger of diminishing for lack of voluntary effort, until the time arrives when Government aid shall be restored to them.

But voluntary effort is too precarious a dependence for remedying an evil which will continue to exist when the pioneers in its redress can labour no more. The inherent constitution of human natures and political bodies ensures a perpetual supply of children needing Ragged Schools. We cannot ensure a Miss Carpenter or a Dr. Guthrie to labour among them; though we may feel the need of such personal influence to animate the work; but we might ensure through Government aid such machinery as should increase the power of good heart-workers when they rise up in their generation, and, to a certain extent, supply their place when for a time they may fail.

A Paper by the Authoress of "Our Homeless Poor, and what we can do to help them." *Read by the* Rev. Sydney Turner, *on the* 13*th of June*, 1860, *at a Conversazione given at the mansion of Samuel Gurney, Esq., M.P.*, 25, *Princes Gate, in aid of* the Society for the Employment of Needle-women, 26, *Lamb's Conduit-street, W.C.*

IN seeking to create an interest in the cause this night to be advocated, it is desirable that the promoters of the "Needle-women's Institution" should make known the motives which led to its formation.

Anxious to test the truth of the tales of misery that met their ear, and of the individual cases of oppression of which this class have long been the helpless victims, they investigated the workings of that human machinery by which mankind is clothed, and can therefore give a correct statement of what they have themselves seen and heard. Though much has been already said on the subject, it is believed that the public have a very inadequate idea of the magnitude of the distress, as well as of the intensity of individual sufferings. The census of 1851 informed us that there are in London alone 43,958 milliners and dressmakers, 21,200 seamstresses and shirt-makers, whilst in Great Britain the needle-women number 400,000. Now, it is an undoubted fact, that, at the lowest calculation, more than one-half of that number are struggling with misery and want. Needlework is the last resort of females of all ranks when means and friends fail them; many are forced by circumstances to descend from ranks of society much above their present state, and sooner than beg or enter the workhouse, they are willing to accept such payments for their incessant toil as will barely enable them to eke out mere existence. Although working longer than men, yet the pittance they receive is often insufficient to purchase food and shelter. Considering this, and the instability of all principle that is not founded upon a living faith, it can be no matter of astonishment that means which result in degradation

Digitized by Google

are resorted to, to secure a few personal comforts, a little cessation from labour, or oftener, to drown the recollections of the past and the fears for the future. Nor does the hard lot of this oppressed class afford any countervailing mental solace. To the poor needle-woman there is no time for relaxation, rest, or culture of the mind; no liberty for the play of thought or exercise of the affections; nothing but a life of monotonous toil, diversified only by the anxiety consequent upon insufficient and uncertain gains. Although but imperfectly comprehending the depths of the misery of this class, yet public sympathy has long been with them, and attempts have been made from time to time to ameliorate their condition; but the evil is found to be so deeply rooted, to spring from such various and conflicting causes, and to be so bound up with the social economy of the day, that with the exception of a few associations, which only partially assist a few by creating an artificial market, no permanent help has been afforded. The cry, therefore, still arises, "We are oppressed, undertake for us."

That "the poor we shall always have with us," and that "offences must needs come," is freely admitted; but we think at the same time it will be as freely acknowledged, that it can be neither in accordance with the divine scheme and the true interests of society, that industrial classes should be thus forced by circumstances over which they have no control, to accept in payment for wearisome labour, wages that are wholly insufficient to support a decent existence. It is not, in fact, a normal condition of Christian society, but a diseased state of the social system; and if so, it surely becomes the bounden duty of every responsible member of society to adopt the means that lie in his power, and which his reason dictates, to mitigate at least, if he cannot wholly reform, these abuses of society.

There are several causes that operate to produce the present distressed condition of this class, the removal of any one of which would, if not entirely cure, yet greatly diminish the evil.

In going about from house to house to visit these poor creatures, with the view to discover any efficient and permanent relief, one fact will forcibly strike every visitor, viz., the very great disproportion existing between what the worker receives for her work, and that which the purchaser pays for its execution. This is due to the peculiar circumstances of the needle-woman's condition. A large proportion of the work-women were never educated to earn their livelihood by their needle, but it is resorted to as a last refuge from absolute destitution. The needle-women, therefore, as an industrious class, are eminently destitute of the intelligence requisite to enable them to dispose of their labour to the best commercial advantage. The extreme poverty and isolated position of the needle-woman also stands between her and a more adequate rate of hire. The same poverty and isolated position has excited a distrust in her employers which naturally recoils upon the whole class.

For these reasons it happens that the material to be worked is not generally placed in their hands, but the medium of a contractor, or middleman, is resorted to, who receives the work wholesale from the shopman or consumer, and retails it to the needle-woman. A moment's reflection will show the enormous abuse this must entail. The price paid by the consumer, if received by the needle-woman, would be barely sufficient to enable her to support life, and procure a few ordinary comforts; but when there is subtracted from this poor pittance the profits of the contractor, the inevitable result is, that the original wages of the needle-woman, barely enough to procure the decent comforts of life, are reduced far below this point. But it often happens that there is not only a contractor, but a sub-contractor too, who necessarily measures out to the unfortunate needle-woman the lowest minimum of wages upon which life can be sustained. Thus we find under the contract system women receiving for ladies' under garments 2s. 6d. a-day, and for common shirts threepence a piece, or sixpence for those that are stitched, a sum which is only a third, or even a fourth of the price paid to the contractor. It is therefore evident that this system of contractors in effect intercepts just so much of what is paid for the work done by the needle-woman as would, if received by her, enable her to obtain with strict economy a decent livelihood. This is the result chiefly of the absence of commercial intelligence and business habits of the class in general, and of the peculiarly isolated and helpless position of its individuals in particular.

It was believed that this evil might be remedied by the intervention of an independent society, which, standing immediately between the employer and the employed, would supersede the necessity of a contractor, and divide amongst the needle-women the profit which the middleman otherwise would deduct; thus enabling each to obtain a larger proportion of the money paid for her work.

A few friends determined to test this scheme, and early in the spring commenced their operations on a small scale, receiving work and employing needle-women, who came properly recommended to the promoters, for respectability of character and capacity for work.

The plan at first met with objections. It was represented that the expense of management would prevent a remunerative return of wages being paid to the needle-women; but this was found in fact to be only a question of the number of workers to be employed by such an institution. If a sufficient number were employed, a deduction of about one penny in the shilling earned by each woman (which is about one-fourth of the amount deducted by the contractor) would, with economical management, enable the Institution to become nearly self-supporting. If this were effected, it is obvious that the system would be free from any objection on the score of political economy. It would be, moreover, the only means of making the remedy at all adequate to the extent of the evil. The principle of payment, therefore, which the Society adopted from the first, was to deduct from the wages a percentage, as a means of defraying the current expenses of the Institution. In order to enable the promoters to make the experiment on a limited scale at first, Mr. Stephen Cave, M.P., kindly made himself responsible for a year's rent of the present premises, No. 26, Lamb's Conduit-street.

The experience that has been derived from the working of the Institution upon these principles, though upon a limited scale, has confirmed these views of the founders, and greatly encouraged them to hope that public support will enable them to adequately extend the operations of the Institution. For this purpose it would be desirable to take a larger house than that at present occupied, making it the centre of a system, having branches in different localities. This will involve a large outlay, which the promoters now solicit the benevolent to supply.

It is hoped, in order to induce the public to accord their support to a more extended experiment, that it will be only necessary to give some idea of the good that has been already effected by the Institution. It has been the means of relieving the most heart-rending cases of distress. A large portion of those engaged, had, during the inclement season, before being admitted, been living upon the sale of their clothes, having nothing left but what they appeared in; others brought their pawn tickets, begging for help to redeem the articles pledged. Several had not tasted food for twelve or fourteen hours, and were too exhausted to work when it was given them. Be it observed,

Digitized by Google

these were women of good character, well recommended, either by clergymen, district visitors, or city missionaries; nor were they confined to the lowest class. Perhaps some of the most touching cases were those of decayed gentlewomen, and governesses out of situations, who were still maintaining a respectable exterior in spite of the gnawing effects of hunger and cold, discernible in their faces.

From the uncertainity of obtaining a sufficient employment few at first could be entered on the books: gradually the numbers have increased to eighty. During the period the Society has been in operation, more than 300 have had employment; as great numbers have recourse to needle-work as the temporary means of staving off actual starvation or the workhouse. This causes the market to be overstocked with this kind of labour; consequently, every means are taken by the managers of the Institution to find more remunerative employment for such of the women as are found capable of it: and during the short period the Society has been in operation, several have been carefully placed in service, and others permanently provided for.

Among other advantages which the Society affords to such workers as are employed on the premises are, skilful superintendence, airy and cheerful work-rooms. Those who have not seen the ill-ventilated, dismally dark and wretchedly furnished rooms, where the needle-women generally pass their long days of labour, can form a faint idea of the very great benefit which in this way is conferred upon them. A few dormitories for the most friendless and destitute have been furnished, the charge for which is 1s. 6d. per week, and if the society be enabled to take a larger house, this great boon might be extended to many a friendless orphan.

Lastly, though not least, it has been the earnest desire of the promoters, where practicable, to combine with their efforts for the material improvement of this class, religious and moral supervision.

The gratitude amongst the workers has been highly encouraging: only one instance of a defaulter with the work has occurred; whilst quiet, orderly conduct has been the predominant feature of all.

To enable the managers to relieve extraordinary and peculiar cases of destitution a separate charity fund has been opened, so that no worker can suffer the extremes of destitution, from illness or other affliction, without her case coming under the notice of the visiting ladies, and receiving adequate attention and relief; this part of the scheme, while it affords various openings for assisting the poor needle-woman, and improving her condition, both temporally and spiritually, also requires an additional and separate corps of labourers. With this view, the promoters desire to obtain the assistance of ladies who would meet from time to time to consult upon and carry out the various means of improvement that might be suggested.

Much good might also be done by reading to the workers, and otherwise evincing a personal active interest in their welfare. If any ladies would therefore give in their names for this purpose, the offer will meet with a grateful response. In closing this report of the Society's rise and progress, and seeking to elicit sympathy for its continuance, a few individual cases among the applicants for work are subjoined, which will speak for themselves and stimulate, we hope, to renewed exertions and liberality in behalf of the class the Society wishes to relieve.

POSTSCRIPT.

Since the above paper was read in June, the Society, as far as its limited means has allowed, has gradually extended its operations, and that, too, during the period so full of terror to the needle-woman, termed "the slack season," when the numbers of applicants are incredible, and their destitution truly appalling.

The more the society becomes known, the greater the supply of work; but the present accommodation is so restricted that, in consequence of the rooms being already overcrowded, the managers have been compelled to refuse applicants, not only on the plea of "they had no work to give," but have also lately declined work for want of space to employ the women starving for want of it. To carry on the scheme larger premises are necessary, and branch institutions desirable.

There are already applications for the formation of twenty new branches.

Government has granted the Society a contract for soldiers' shirts. If funds can be raised for the outlay, it is proposed to open work-rooms this year.

Notwithstanding the positive good the Society has done, is doing, and might do, the promoters dare not launch into the necessary expenditure without adequate funds. To take a large house in a suitable neighbourhood, and to open these branches, a capital of about 1,500*l.* would be required. An earnest appeal is, therefore, made to the public to give their money and support towards this object.

Donations will be thankfully received at the office of the Institution, 26, Lamb's Conduit-street, addressed to the Secretary; also, at Messrs. Prescott, Grote and Cave, Bankers to the Association. Post-office orders may be made payable at the office in Lamb's Conduit-street.

CASES.

J. W., a Governess out of a situation, asked for 1d. to purchase a bit of bread as breakfast—had had no food the previous day. No shoes to her feet.

E. W. T. had worked for one shop five years—commenced at five A.M., worked till eleven P.M. Earned from 2s. 6d. to 6s. a week, according to the season.

Mrs. M., boot-binder. Earns from 2s. to 4s. a week for thirteen hours' daily labour.

M. B., widow, thirty years a needle-woman—no other means of support. Makes shirts at 3½d. each, six button holes in each. Can do two a-day; finds her own cotton, light, and fire.

W. L., a widow with two children, works for a city warehouse at ladies' under-clothing. Takes petticoats with tucks, hem, and body at 7d., chemises 6d., drawers tucked and hemmed 3½d. each, babies' shirts 3d. each, finely stitched.

Mrs. T., a most respectable person, thirty years a needle-woman. Has often made ladies' under-garments, with gores and stitched bands, at 3s. 6d. a dozen. Herself and daughter could do two in the day, working thirteen hours; shirts 5d. each, babies' bed-gowns 2s. 6d. a dozen.

Mrs. W., in affluence four years since, works for a contractor. Makes button holes in gentlemen's collars, each collar has three holes; her payment 3½d. a dozen collars; 2½d. for boys' ditto. Works from five A.M. to eleven P.M., and has done so for two years. Herself and daughter can earn between them from 7s. to 9s. a week. No other means of support.

Mrs. M., works at shirts at 6d. each; each shirt has fourteen button holes.

Mrs. M. Her husband was a civil engineer; lost everything in the failure of Strahan's bank; obliged to take to her needle; works for a contractor; makes gentlemen's shirts with stitched fronts at 7d.; night shirts, 3d.; can do four of the latter a day, working from six A.M. till eleven P.M.

H. R., works fourteen hours a day at button-holes, earns 4s. a week.

J. C., an orphan and friendless, worked for four months for a contractor at army braces; began at seven A.M. and worked till eight P.M.; allowed half-an-hour for meals; when asked if that was time enough, replied with tears and sobs, "Long enough, Ma'am, for a crust of bread; I'm only paid 2d. a dozen, and can't earn more than 2s. a week;" had been a servant till ill-health broke her down. Had lived five years in one situation.

LIGHT FOR THE BLIND;

Or Short Rules for the Parents and Teachers of Blind Children, and Remarks on the Present Condition of the Blind.

"A little onward lend thy guiding hand
To these dark steps."—SAMSON AGONISTES.

THE great misfortune of blindness is the dependence it entails. Among the number of individuals who, either from their birth or later infirmity, are thus afflicted, only those can be considered really miserable who, allowed to remain incapable of helping or acting for themselves, find every moment of their lives subjected to the will and convenience of others.

The sense of calamity, roused by a state of existence which the mind even of a child discovers to be defective from the pity it inspires and the restrictions it occasions, comes to be a ruling influence of life. Feeble and ailing health is the result of compulsory physical inactivity. And where no scope for exertion is allowed, conscience is disturbed or stifled by the moral depression that falls on those who are without a share in the mutual duties owed to one another by all thinking beings. Is it to be supposed that under any circumstances Providence allots to an intelligent creature a fate as useless as it is unhappy? a course of trial to which no task is annexed; and whence no fruit is to be reaped? Can we think that God gives to the blind child other senses and faculties, not to repair, but only to render their possessor more acutely sensible of one deficiency? And yet must it not be allowed that in the care usually bestowed on a blind child, as well as in the mode of treatment most frequently adapted to the altered lot of those who suffer in later years the loss of sight, this misapprehension of a Divine purpose is perfectly carried out, aggravating instead of obviating the helplessness of such a state?

The aid of public charity, open to the blind under the form of shelter and a partial mode of instruction, is available but to a few. The blind institutions in the United Kingdom of Great Britain cannot altogether contain 1,200 inmates, and there are in the different stations of society 30,000 individuals deprived of sight. Of this immense proportion all, however, unless in exceptional cases, belong to families more or less capable of intelligent efforts for their welfare. Many of them have wide connections and friends. Among this number, the two-thirds who, it is computed, become blind after the age of twenty-one retain certain advantages;—the claims of a misfortune that can appeal to past ties, and the power of asserting the will from habits already formed. Were it generally comprehended how much the cultivation of this power on the part of the blind is the duty of the seeing, it would soon be found that it was one certain of requital, and that not the blind alone received light in a mutual intercourse. But for this duty to become a thing of course it should, like a book of history, begin at the beginning, that is, with the real representatives of blindness—the one-third born without sight. Its rules should be practised and set forth in the infant's home; and it is through the intelligent attention there given to the earliest needs and claims of the sightless that their condition will become one of freedom, activity, and independence, or by the continuance of an ill-judged care, almost more pernicious than neglect, that they will remain as they now are, an isolated class of human beings.

It may be said that the greater number of the children who are born blind are either in the families of the poor, or in others whose influence cannot extend beyond the children of their own home. This is quite sufficient. Every blind child properly trained, besides the benefit he obtains from his own acquired independence, will be a step in advance towards the improved condition of all his fellow sufferers. With a good will and a little intelligence numberless ways and means are opened to the poor for enlarging the capacities of the blind. Of course the better the circumstances and education of the parents, the greater is their scope, although often the cottager's wife, from constant access to the open air and hardy habits, may bestow a healthier training on her child than others. All may do what they can. The woman who becomes the mother of a blind child receives with her affliction a very particular responsibility. She must not suppose that the Almighty has thrown a burden on her hands who has claims indeed on the pity and complaints natural to maternal fondness, but who is no more capable of benefit from a sensible and enlightened mode of training than if bereft of much higher gifts than sight—those of reason and intelligence. To overlook this child's demands upon her power of lessening the difficulties of his after life is to reject her appointed work and to increase the burden she deplores, while, by raising from the very first her blind child as nearly as possible to a level with those who have all their senses, by showing him he is no more dependent than God designed, and not so from want of human aid: by teaching him to assist himself, and strive for himself as others do, she lessens, in a material sense, his trial and her own, and will, in the satisfactory result of her efforts, learn to lose sight of it as one. Had you a lame child you would think it hard to find no means of supporting his limbs; you would try to enable him to walk, and the more easily he got about, the greater would be your consolation. Why not supply the want of sight to another child? Why not exercise for his alleviation the faculties of hearing, touching, smelling, and reflecting? Why not teach him to do for himself all you think you must do for him? and instead of subjecting him to the pain of thinking that he gives trouble to others, why not allow him the means of being useful on his side—whose abilities may be capable of more development than those of many others blessed with sight? It is, perhaps, in your power, it may be your wish or intention, to place your child in one of the schools exclusively devoted to the education of the blind, where he will benefit by methods of instruction not practicable for him at home. But there are still the first ten or twelve years of his life at your command, years that are of the greatest consequence to you as they are to him; nor must you leave his childhood a blank, or prolong the helplessness of infancy so far that he will never afterwards be able to make a fair start in life. Employ these years in forming his earliest intelligence, and in bringing him to comprehend the lot in which it has pleased God to place him, as one that imposes great duties towards himself. Begin the education of your blind infant by making him exercise his limbs, in order, gradually, to teach him to take care of himself, and to get on without assistance. The more independent you can make the blind child, the less is his misfortune, and the greater your comfort and encouragement in rearing him, and a little more time and trouble than you give to your other children will be repaid by the rapidity with which he will get over the difficulties of want of sight in doing for himself all that they learn by seeing what is done, and in taking such a place amongst them in his home as will add to your happiness, instead of being the check upon it that want of care and attention would make inevitable. Your first method of management may be nearly the same as that you employ for the other children, with rather more instruction and watchfulness in getting him to use his hands, as they do who learn from imitation; indeed, if the child attempts what he is told to do, and finds a way of succeeding, not the same as yours, let him adopt the easiest manner, so as it gives no offence; the requirements of his condition should be allowed for. You have only first to make clear to your blind child what is to be done, then to let him feel how you do it, and then, if he cannot imitate you exactly, to let it be done his own way. The less you do for him, the more he will try to do for himself, and he will attend to your precepts far more conscientiously than the careless child who sees, from feeling that in your instructions you bring forward the evidence of a sense he has not. Thus, the fear of dropping, or of damaging the things he touches, by holding them in a wrong way, of getting his clothes soiled, or his playthings broken, by throwing them about, or putting them in unfit places, will have a great influence with him, much greater than with children in general, who prefer to learn through their own experience, and suffer for it, rather than follow your counsels.

Do not suppose it necessary that because your child is blind you must carry him in arms longer than is usual. Teach the infant as early as it is possible to walk without being led, to find his way about alone, first in the room, then throughout the house, and in time, when able to move with confidence and freedom everywhere out of doors. And although precautions must be taken to ensure this being done with safety until he has been so familiarised with the surrounding objects of his home that there is no longer cause for alarm, yet should the blind never be too carefully guarded, but be taught to acquire by very early independence that liberty and self confidence that will prevent their after life being embittered through timidity and rendered joyless from inaction and monotony. They must throughout infancy be allowed, enticed, even urged, to run and

Digitized by Google

play with companions of their own age. Your blind child must also be taught to feed himself with what is set before him, to dress and wash himself, and when all this and whatever else he requires to do is learned, none of these things must be done for him, that the habit of self dependence once acquired may be kept up. As the blind have to supply with their hands the want of eyes, the child must be unceasingly practised in the use of these indispensable instruments. Weak, incapable and useless fingers are a greater calamity than sightless eyes. To make the fingers active and skillful, teach him him all the possible functions, and for the sake of practice let him be constantly presented with things for his hands to touch, to grasp, to raise, carry, push, pull, slide, &c. This will strengthen both arms and hands, which will otherwise become powerless and stiff. Remember that means for his instruction and amusement are always within your reach, not only in the form of toys or of any objects that occupy the fingers, but amongst those that arrest the sense of hearing, and that induce the exercise of the body. The following toys may, according to the age and circumstances he is in, be recommended: a rattle, a drum, a ball, whistles, pipes, animals with voices, marbles, nine-pins, a glass harmonium, wooden bricks for building, a wind-mill, a turning-wheel, squares of wood or ivory with letters or numbers cut upon them, baby furniture of all kinds in clay, wood, brass, iron, and china. And for girls, also dolls with all their clothes. It is very useful to make blind children imitate the shapes of any of the beforementioned articles in wax or paste, or in any pliable materials, comparing by the touch what they make with what they copy.

It will also be of use to mix together grains of different forms and sizes, such as peas, beans, lentils, rice, barley, oats, wheat, Indian corn, &c., and teach the child how to separate and assort them under their different names, telling him at the same time their different uses.

All the objects the child touches should be mentioned to him by their names, and these names repeated until he knows them thoroughly.

You should pronounce each name correctly and distinctly, taking great pains to make the child do so too, and never be satisfied until he has repeated your words as perfectly as they were said to him, nor teach him new words before he has well practised those he has already learned. You will rarely find the blind slow at learning; his ear is generally both quick and true, and that he may neither lose the assistance or enjoyment of a sense which is to him a main channel of interest and knowledge, this one should be continually exercised. Adopt the habit of talking to your child, and of forming his mind by your questions and observations. The faculty of discerning and distinguish ing sounds, an acute sense of harmony, and a great aptitude for the science of music, have been often made the resource and compensation of lightless solitude. If you perceive your blind child to have this taste, let him be taught to sing or to play upon any instrument that may be within your means, or that he has a fancy for. There is no condition so favourable for perfecting musical talent, and, indeed, the blind have been thrown too much upon this one as special to their condition, and the only one available in their circumstances. Now, although there may be some mistake in this, they have generally an acute power of feeling sounds such as in many cases might lead to superiority of expression or composition, and prove a source of enjoyment quite beyond the conception of many who have eyes, but are not gifted with a musical ear. So far, then, from supposing that the infirmity of your child excludes him personally from enjoyment, and throws him a dead weight on your hands for life, remember that it may be in his power to repay every care you bestow upon him by the exercise of abilities that only for want of your help will lie dormant. Various modes of musical professions are open to him, and will become more easy of access if more attention is given to the improvement of the blind. There are now many pianists and tuners of instruments without sight, and as teachers of music in schools and families they might equally succeed. And although eminence in all professions, whether musical, mechanical, or intellectual, is rare with both the seeing and the blind, it is always possible your child may become a great composer or a distinguished performer, and it is at all events certain he may look for interest and occupation in his art, and, if requisite, the means of gaining a livelihood in it. Without aspiring to one of those names that testify to the marvellous powers of the blind, he may take a place either by accuracy of ear, manual dexterity, or thorough strength of understanding, among our ranks of musicians, mechanics, or the literary characters of the day. In everything that is taught, it must be recollected that too much at a time, or too many things at a time, ought not to be forced upon his attention. Children whose sight is in constant exercise have thereby a means of throwing off the fatigue of an overloaded memory; the recreative faculties come to the relief of the studious ones when oppressed, and even the memory itself, with the aid of sight to distinguish one thing from another, is equal to a heavier task, and merely forgets what is too much for it. But the brain of the blind undergoes a feverish disturbance under the stretch of thought, and inextricably confuses the ideas you have implanted. Repeat, therefore, always diligently, what you teach, and one thing at a time, till it is well understood, and only when that has been practised and taught radically go on to something else. Teach your child to dress and undress himself, to make a knot, to tie a bow, to fasten and unfasten everything. This he will do after a few attempts in which you have guided his fingers: make him fold up the clothes he has taken off, and let him be taught how to hold his spoon, how to fill it and guide it to his mouth, and later, the use of the fork and the knife. Both in dressing and in eating, habits of order, cleanliness, and decency are perpetually to be enforced upon the infant mind of the blind. Learning nothing by imitation, and only comprehending what should be done from being told whenever he does well or ill, it is most important to teach him clearly and explicitly all that these require, and never to let any forgetfulness of or offence against them pass unnoticed; you cannot too early rouse a sense of bashfulness and shame. It is easier to prevent bad or slovenly habits by the direction you give to the mind than to eradicate those that have been fallen into. Teach the child how to place himself at table, and, whatever he is about, to stand or sit with propriety. Instil into him the minutest attention to decency in his actions, manners, and postures; let him know whenever he makes himself offensive, why, or how he does so, and restrain the child from any ungainly tricks or ways that shock the sight of others; shaking the hands or feet, lolling or stooping unnecessarily, rocking his body about while standing, boring his fingers into his nose or eyes, or scratching himself, &c. Impress upon him that the fingers are always to be usefully, and never idly employed. These habits of neatness and general delicacy will be very much promoted in the mind of a blind child by frequently recalling to him that his transgression of their rules produces an unfavourable effect on the persons around him. Yet we have to bear in mind that they can only become principles of conduct by being founded on far higher motives than those of human respect. The approval he must be taught to seek above every other is that of the All-searching eye, which never loses sight of him; indeed, the watchful presence of an unseen Father in Heaven should come nearer to the apprehension of the blind child, to whom the friends and parents of earth are equally unseen, than to any other portion of humanity; and this sense of a will and a support, always within reach and ever directing the helpless and the innocent, should be imbibed with his first instincts of intelligence.

In training the conscience of the infant blind, believe that example will of all things render it the most docile to your precepts. A pure and benevolent tone of mind in your child's home and among those in whose charge he is left when you are unable to attend to him, will enforce the tone of what is good; while, by leading him to notice the results that occur from evil principles wherever such come in his way, he will be led to shun their contact, and hate their practice. In giving the blind child companions of his own age, which is quite requisite, let them be such as you are sure of; that they hold no bad language, nor tell lies, nor play tricks, nor deceive, him, nor teach him anything wrong. Be yet more particular in this than you would for those who can see. There are for these, as you know, such numberless attractions in outward objects, that the passing influence of an evil tongue may be swept away before a thought has been wasted on it. Like the images upon the white sheet of a magic lantern, one impression slides off the surface of an infantine mind as another rises over it, and nothing that is not habitual or persistent appears to sink in the memory or leave the taint of its track upon the light heart of childhood. Indeed,

Digitized by Google

sight being the sense that is most constantly at work, is more easily amused than that of hearing, and it forms a balance of no little value against bad impressions. The Almighty has furnished so many pure and pleasing images in Nature, ever new and gladdening to the eye, that the charm and interest of her aspect, while it satisfies the feelings, keeps them clean and healthy. But your blind child is not free to benefit by this outward diversion that falls with the light upon the senses of his companions, and, as the air of heaven upon the earth, clears and disperses all infection from them. His soul is a captive, the atmosphere of whose prison must be lighted by the more watchful influence of spiritual purity in the same way that an ever-burning lamp rarifies the gathering vapours of dark places. Contrast for a moment to yourself the different susceptibilities of mind that distinguish the seeing and the blind. Look at those two children on a fine summer's day walking hand in hand together along the gay meadows—through the glades or woodlands that are the haunts and scenery of their home;—observe how the impressions of each are formed; and you will easily allow that in the case of the latter a special source of treatment is required.

That little being, whose vague uncertain tread is guided by the light firm step at its side, has a range of feeling and perception in most instances all the more sensitive from its defect of sight, and, therefore, not so much excluded as you would suppose from the power of enjoyment, though in greater need of direction and support in order to benefit by the bounteous influences that Nature adapts to all the senses. The mind of your sightless child can be taught to fill the scene around him, and draw its own delight and interest from the veiled images that are open to the other.

Whatever you have told him about the world he lives in—of trees and fields, vales, hills, waste land and cultivated, woods and waters, he will discern and recognise in his particular way, according to their accompanying atmosphere, their sounds, scents, and divers distinctions. From the few shrubs, plants, and herbs that you have been able to teach him by name, he will find out contrasts, varieties, and uses in vegetation such as you never have yourself discovered. Nor are the perfumes of the air merely evidences of objects to his sightless eyes. They are for him likewise impulses of feeling, channels of sympathy and warnings of aversion, spirits that surround his vacant hours of solitude with all the life and movements of our social passions. Every green and growing thing conveys to his mind with its morning freshness its evening power, a new perception or association, and each impresses on it God's baptismal record, "That they were *very good*."

"I cannot see what flowers are at my feet,
Nor what soft incense hangs upon the boughs,
But in embalmed darkness guess each sweet,
Wherewith the seasonable month endows,
The grass, the thicket, and the fruit tree wild,
White hawthorn, and the pastoral eglantine,
Fast fading violets covered up in leaves,
And Mid-May's eldest child,
The coming musk rose full of dewy wine,
The murmurous haunts of flies on summer eves,
Darkling—I listen."

For his attentive mind and well-practised (perhaps naturally tuneful) ear, Nature's profuse speech has accents and vibrations indefinable to the hearing of his companion.

The atmosphere's surrounding tones, that stir the spirit of the seeing-boy as tongues of his playground and sports—with thoughts of birds'-nests, orchard-trees, and other excitements of the childish passion of activity, declare to their blind listener the reality and meaning of things your lessons have but suggested to his mind. Those tongues that ever sound the rhythm of Time's great theme, mortality, give him the note to its sensations and divers states of being. He forms his thoughts of love and strife, of joy and sorrow, progress and decline, from changing concerts of hours and seasons, that tell the year's revolving story and his own; he dates the facts of his blind life by wintry dirges, vernal chimes, and sultry symphonies, tracks the sun's course through busy day on Nature's inharmonic dial of endless modulation, and hears night's hour of rest in concords of the earth, that we call silence.

You, who instruct your child through his organs of sound, sense, and touch, can never say to what extent his capacities may reach. We accustom ourselves to rest so much upon the evidence of sight, that we neglect the real exertion of our other faculties, and fail to remember that each sense in its proper condition, and at its full stretch, is as true and accurate as another. Often where sight is extinct its life passes into the other organs, and gives them a double power, and this we may always hope for, and be prepared to act upon with the blind; and yet, notwithstanding this fact, the modes of impression varying according to the sense that receives them, and sight, being the only one through which the mind is practically directed, be ever on your guard for those who are bereft of its guidance, that they be not thrown too much upon the ideal and dreaming enjoyment the other senses can afford them, and which will thus render the life of the blind in its social view a blank.

This worlds' duties and useful aims are far more hidden from your blind child's sight than are its material images.

Ties and claims that at every step meet the conscience of his comrade, the hardy truant who climbs the trees and robs the birds'-nests, and whose senses reflect upon his brain no ideas but those of mischief and pursuit, never face your sensitive questioner of sounds and odours. Which ever way the seeing boy may lift his eyes, they rest upon some rule, some habit, some example that speaks from out the familiar images around him, and acts unconsciously upon his mind and feelings.

That circling smoke is the home where he was born and lives, that spire is the church where he learns to pray.

Perhaps, already in its place of graves is a sod at which his heart swells daily as he passes. He dwells amongst moral symbols and sacred mementoes.

He is surrounded with illustrations of the truths and precepts inculcated to his ear. In the surplice of the parish priest, even in the spectacles of the village dame, distinctions are embodied to his apprehension that demand respect and enforce subjection. Lazarus and Dives have each their moral for his eye. The looks of cleanliness and order act upon his sight as incitements of industry, and the seed-time and harvest bear out to his view the edict of man's fall,—"that he is to live by the sweat of his brow,"—and its compensation.

Where will your blind child find the incessant attestations, reminds, and attributes of duties that are conveyed to the moral sense by sight? Where, above all, will he meet, what tells more on the mind than Nature's pictures or domestic examples, the eyes of others on his own conduct, acts, and words,—the reprehension or encouragement of the human countenance?

There are few moral restrictions equal to this influence of man on man; it is the only power that corruption cannot pervert, that guilt does not resist, that vice is unable to assume; and that light from a mother's eye, in which the infant reads its duties and transgressions, and whose language he retraces amidst the temptations of later years as a living table of God's commandments, you can only replace to the sightless by the inflections of your speech, as well as by the particular instilments and attention with which you form his mind and keep up practical views and habits for his daily life.

Let the tones of your voice rule the tenor of his inward mind as entirely as your vigilant eye keeps your other children from falling into active mischief and harming one another. If the tender sounds of a mother's love fall first upon his heart, the child will be soon brought to understand the meaning of a greater and a more perfect love, and will draw from your care the sense of a Divine presence ever with him. Always speak to him gently and kindly, with earnestness when requisite, and, if obliged, with strictness, but never in vehemence or in anger. The blind must never be intimidated, terrified, or thoughtlessly startled. When you consider what the sensibility of the nervous system must be in a child who feels itself at the mercy of everybody and every creature around it, who has no defence against its own impressions once received, and whose other senses are perpetually on the stretch to do the work of the one which is deficient, you will feel that there can never be too much consideration in the physical training of so delicate a set of nerves: that gentleness alone will enable him to get on with steadiness and confidence, and that at once you might ruin your own work and blight his welfare by any sort of shock which his organisation is without the means of repairing. While you bear always in your own thoughts the susceptibilities of a condition so open to injury and so much in need of alleviation, spare its object all sound of unenvious regrets and complaints at his own state: otherwise, you will but sour a mind that should be full of charity and sweetness. The blind child is happy, and does not know himself

Digitized by Google

to be unfortunate unless you make him feel he is so. By your example he will learn as he grows up to coincide in the will of God, as in that of an all-wise Father, taking courage for the fulfilment of his lot in life, and hoping for a dear partner to share it with him.

The subject of health must not be left here altogether unnoticed, as it demands very particular consideration in the rearing of blind children; the healthiness of the mind has a great deal to do with the healthiness of the body; when either is impaired, the other suffers, and where motives of physical exertion do not readily present themselves, they must be stimulated or all the powers will decline.

The child ought to be as much as possible in the air, and should be left with other children in some open space where he may be able to move about independently, and play without danger of being hurt. On no account condemn the poor little fellow to remain quietly on his chair in the room. If you watch the blind you will see how irksome their stillness is to bear, and that they are continually rocking themselves backwards and forwards to soothe the nervous irritation that is brought on by want of movement. Gymnastic exercises should, if possible, be taught to the blind child, to give that strength and suppleness to the limbs which inactivity destroys by relaxing and impairing the play of the muscles and sinews. It will be well also to employ him in any household business that is to be done,—making the beds, washing up and putting away the tea-things, and, when strong enough, in sweeping and cleaning the room.

To give a stimulus to exertions and lead the child to feel that he is of use to others, instead of being a charge to them, he should often be occupied for his parents, brothers, and sisters; and on all little occasions may be employed by them, as to take messages, to fetch a chair, or anything else that is wanted, to carry things for others, &c.

In the way of sedentary occupations there are plenty, such as being taught to plait and net by his mother or sisters, and if a girl, hemming, sewing, knitting, crochet, &c. Not only will employment arouse the mind, but the object of assisting others will take it out of itself, and satisfy the feelings and conscience.

If you have your child's welfare at heart, you will find in everything around you the means of his instruction. The more the objects you make use of, the more will present themselves to your attention; all household articles may be touched and handled according to their various uses and natures, even those that are dangerous; the child had better hurt himself than be deprived of this freedom, though you should warn him, where by touching he will be cut or burned, or hurt in any way, and then if he wishes to try, let him run the risk. Domestic animals will be soon distinguished to the mind by their different forms and sizes, their hair, wool, or features, as well as every kind of fruit and flower, and the senses may be continually exercised by questions.

What do you hear now?
What do you smell?
What is being cooked in the kitchen?
What is it that has fallen on the ground?
What flower do you smell?
What do you taste?
What animal's cry is that?
What bird is singing?
Whose voice, or whose footstep do you hear?
How do you call this substance?
Which is bricks?
Which is wood, stone, glass, leather, metal, &c.?
Is this soap, wax, suet? and so on.

By the help of divers objects in the house, garden, fields, or workshops, of various trades, and by naming to him instruments, utensils, &c., their single parts, how they are put together, the mode of manufacturing, and the purposes for which they are to serve, the blind child may be amused, instructed, and made serviceable to others, while, at the same time, he prepares himself for a life of more diffusive usefulness and interests.

Look to the examples of eminence to which the blind have attained in various pursuits, artistic, scientific, and active. Do you suppose that any of these cases are to be cited from among the uninstructed, the unaided, the unstimulated; or that any solid superiority was ever reached by the sightless, unless their first acquirements were suggested and promoted by those who see? Their powers are their own, but the modes and means of applying them rest entirely with you.

This practical course of education having no other aim than to do away with the barrier that shuts out unassisted blindness from society, the child whose mind you wish to form, ought, so long as he remains at home, to follow the rules and habits of the other children. He should always take his place in the Sunday-school, where those, either of his family or neighbours attend, and, in turn with them, answer the questions and repeat his Catechism, &c., and, indeed, in the same way go to their week-day school. There will always be found some relation, fellow-pupil, or friend, to lead him there, to sit by him, and help him to understand what is going on, and without individually taking a part in the reading, writing, or summing, on the slate, a great deal will yet be learnt that is useful. The rest of the day the child should be as much as possible out of doors; the more freedom and fresh air you give him, the clearer and stronger you will find his mental apprehension. On these years of childhood depend his future vigour of mind and body; neither must he be subjected to confinement or left inactive. When the powers of observation are fully awakened, the reasoning faculties of the child may be exercised by frequently presenting to his notice subjects of comparison and contrast, and suggesting ideas and reflections. He must be taught to count, and then the plainest rules of arithmetic, which, when learnt, should be practised from memory. Different measurements also may be made familiar to the discernment of a blind child. Lengths and quantities, by rules, of inches, feet, yards, &c., by weights and vessels of certain sizes, according to drachms, ounces, pints, pounds, and so on; and distances can be defined by inducing him to note them by paces, from which he will be able to calculate further. Amuse, also, your child by making him guess easy riddles, and by relating short, simple tales. Exercise his memory with the repetition of moral rhymes, little hymns, prayers, psalms and verses from the Bible, particularly from the New Testament; explain to him the system of his redemption; often read aloud the life led by the "Man of Sorrows" upon earth. Teach the beauty of the example He has set us, and how we should look to the salvation we are offered. Let words of blessing, encouragement, and holiness, ever greet the blind child's ear; nothing but what is kind, lovely, chaste, and spiritual, fall upon it: usually they retain with tenacity not only what is taught, but what is said to them. Sow, therefore, no bad seed in the heart where you would not reap bad fruit. Try to impress the companions of your blind child of the same age, with a certain respect for the purity of his mind. Recommend it to their protection as you do his steps,—that as they know it to be a duty not to mislead the one, they may likewise spare the other all sounds of coarse unseemly language, abusive epithets, hard words, oaths, or lies.

Let it be, above all, a serious point of honour and of conscience with seeing children never to make to the blind false excuses, false explanations, false descriptions, or use with them false terms of any kind.

There cannot be a doubt of the injurious effects of negligent or purposed insincerity with those for whom the rectification of fraud is in many cases impossible, and on whom the effects of deception are always lasting, either as misleading the mind or destroying its confidence. Make both children and grown persons who surround the blind feel, if you can, the meanness of an offence that is based on the security from retaliation, and consequent indifference to the convictions of the being who is wronged, for rarely they who act thus trace the selfishness or treachery of their conduct.

Many who would execrate the notion of setting the footsteps of a brother on the ice because he sees not where he treads, and who would scruple to put a stone in the path of the blind, have not hesitated in causing his thoughts to slip and swerve from the realities of outward life, tilting the balance of the mind on which judgment and opinion rest.

Nor does disloyalty towards the sightless consist in imposition only, in subterfuges, evasions and quietism, but in every neglect of the duties our eyes impose on us in keeping them fully and clearly aware (as fellow-members of society and not predestined inmates of asylums and objects for exile education) of whatever takes place and passes in daily life. Among children, the habit once given of informing their companion of all that is to be observed around him, will become more an amusement than an exertion. Mind, however, that it be done with conscientiousness and kindness, so that the blind child shall be encouraged to state what he wants to know, where he is puzzled or at fault. In describing new places that he is

Digitized by Google

brought to, how the people are dressed, what happens, and what part every one takes in what is going on, and the positions and distances of objects, great accuracy should be observed; his own impressions should be inquired into and carefully set right when erroneous. Those who are able should prove to him how and when they are correct, and give him every facility of convincing himself that what they declare to be is so.

This will establish the blind boy's confidence in himself and others, without which he can never feel happy or secure, and it will arm him against future attempts and occasions of deception, by which he might be made to suffer acutely.

Indeed, this consideration of ample and explicit truth with the blind, is the great question of their destiny, both in their rearing, maintenance, and lot in life.

It is one to which some of the most cultivated among them have urged attention, and not received it; and, perhaps, those only whose loss of sight has been followed by the loss of truth—usually the case—can plead with force enough for this point in the training of a class of children who have in common with all, a life before them of responsibility, but are not allowed their proper part in it; this is the grievance of the blind, their cry, their case.

For an active and enlightened career to come within the blind man's power, he must indeed have been from his cradle mentally familiarised with all objects, subjects, and images that belong to the seeing world.

No new ideas are to be gained in the asylum pervaded by one infirmity, or among a company of sufferers, all equally in need of what they are alike debarred from. The feeble mind is stupefied with the exclusive contact of its own trial; the generous and aspiring mind embittered; and the spiritual exhausted by the monotony in which it pines. They want the light of freedom, movement, and change; the conscious sense that they too, with all the world, are going onwards; that they are not encircled by impracticable walls and barriers; not always destined to find a crumbling ground give way beneath their feet.

There is something very shocking in the idea of a system of philanthropy that keeps up an unfavourable action on the minds of a whole class of human beings under which the highest effort of intelligence must be discontent; and, in which all who comprehend their own case, feel that the succour they receive is brought down to their infirmity, instead of raising them out of it, and supplying their losses.

As regards the position of the blind in the world it will be naturally asserted that it must vary in advantages and disadvantages according to their circumstances, family ties, their own capacities, and the nature of those persons they are nearly connected with. Consideration and generosity, as a public claim, will not be easily admitted, and cannot be enforced. Yet, with the world, the influence of example comes next to that of law; and if the institutions intended for the welfare of the blind, took up a more enlarged scope for their education, and methods more calculated for their social improvement and happiness; joining them in separate classes with the schools of the seeing, and directing their endeavours to bring out their various capacities so as to enable them to make their way in life, the world at large would bow to the obligation of referring their own way of acting with the blind to this standard, and of trying to come up to it.

And yet above the force of example, above the education of the schools for the blind, however improved and perfected, will always be the influence of a mother's care, the teaching and guidance of the child's earliest years at home. The end proposed for them of a happy and a useful life, must begin with the careful training of enlightened affection, by a watchful attention to all their needs of exercise, instruction, and independence. It is the friend of the infant that is the real influence of the future life of the man. The channel of light to the blind is the woman who wakens those powers that are later to be brought into action, and first opens his perceptions to the mysteries of the world in which God has placed him.

Raise your child above the reach of the present system of blind education and protection, and its methods will likewise be raised and enlarged to meet his needs and assure his welfare. To the care of the enlightened mother, the intelligent teacher, the blind child alone will owe the footing that he gains in this world, the light that leads him to a better.

"The steps to that portal, by Jacob in slumber
Once seen, but too many and glorious to count,
Your eyes reillumined shall measure and number,
Your footsteps, assisted by angels, shall mount.
Await, then, in patience, His second descending,
Who came the dark fetters of sin to unbind,
And to cancel the sentence on mortal offending,
With words for the speechless and sight for the blind.
And perhaps the bright vision of splendour unbounded,
Shall burst on your long darken'd orbs more sublime
Than on those which the world with its glare has confounded,
Or dimm'd with its mists of corruption and crime."

(*Written after visiting the Blind Asylum at Edinburgh.*)—*Poems by the Earl of Ellesmere.*

North Surrey Industrial Schools, Anerley.—The annual *fete* for the children of these schools (now 740 in number) came off with great *eclat* on Thursday evening, Jan. 3rd. The entertainment consisted of a selection of vocal music, sung by the officers and children, under the direction of the superintendent (Mr. Smith), and the chaplain, Rev. O. J. Vignoles, together with a performance by the school band, under the skilful guidance of Trumpet-major Lawson, Royal Artillery band. Between the parts prizes were distributed to to the most deserving children by the chairman, Mr. J. L. Bennett, who, with her Majesty's Inspector of Schools, Mr. E. C. Tuffnell, afterwards addressed the officers and teachers, in the presence of the visitors, congratulating them on the general efficiency of the institution and the healthy and happy appearance of the children.

Correspondence.

To the Editor of the Philanthropist.

Sir,—In your last number you appear in a leading article, to adopt that most unfortunate mistake, that building cottages must be looked upon as a free gift to the labourers, more than as an investment.

The safest of all investments is to lay out 160*l.* in a pair of plain cottages, and let them, with half an acre or an acre of land attached, to industrious labourers. They can very well afford to pay 5 per cent. on such an outlay, and an ordinary tenant's rent for the land. Over and over again it has been objected that where the wages are nine and ten shillings a-week no such rent can be paid. So far from this being the truth, the fact is, the lower the wages are, the *greater necessity* there is that the labourers should be protected from fever and ague, and be spared from walking two or three miles out and in every day. In the time so lost he would earn his *whole rent* in his garden. The most injurious statement to the labourers which has ever been made was by a landowner, who said that in no case should the rent be more than one shilling a week, and that the whole of this sum would be consumed in repairs.—I am, your obedient servant, Charles Neville.

Wiseton, Jan. 18.

Edinburgh Ragged Schools.—A few weeks ago an appeal was made to the benevolence of the public to make up the deficit of £700 in the funds of Dr. Guthrie's Ragged Schools, caused by the limitation of the Privy Council allowances, the alternative being held out of the dismissal of seventy children to the streets. So well has the appeal been responded to that Dr. Guthrie now announces that he has already received not £700 but £2,165. "In this way," the rev. doctor says, "the public have most emphatically pronounced their judgment on the case of Ragged Schols *v.* Committee of Privy Council on Education, and have furnished us with means which, added to our usual annual subscriptions, will enable us to maintain our schools in their present efficiency for three years, before the expiry of which time, I have no doubt, the Government will have had their eyes opened to the error of their ways." In Kirkcaldy and some other towns the reduction of the grants has led to the closing of the Ragged Schools.

Holloway's Ointment and Pills.—Good Digestion—Clear Complexion.—Our winters abound in such constant changes of temperature that skin diseases always prevail at this season. Rough skin, chapped hands, and pimples, are the simplest class. These admit of easy cure by smearing Holloway's Ointment over the affected portions each night at bed time, while his purifying Pills are taken in such doses as the system will bear without inconvenience. This is a safe and easy way of removing all skin diseases depending on irritation caused by atmospheric changes. When cutaneous complaints arise from disordered digestion the same means will be found serviceable and always curative. Any person on reading the "Directions for use" can apply Holloway's remedies with certain benefit.

Printed for the Proprietors, by Woodfall and Kinder, Angel Court, Skinner Street, London; and sold by W. Tweddie, 337, Strand.—February 1, 1861.
